Reader's Guide

The Reader's Guide is provided to help readers find entries on related topics. It classifies entries into 20 categories: Alliances and Allies, Potential Adversaries, and International Organizations; Civil-Military Relations; Diversity; Educational Institutions; Intelligence; Law/Military Justice; Leadership; Logistics, Supply, Equipment, and Transportation; Media, Military and Public; Medical Care, Disability, Veterans, and the War Dead; Military and Civil Society in the United States; Military Life; Military Organizations and Commands; Operations and Tactics; Personnel: Recruitment and Training; Strategy and Strategists, Military Intellectuals, and Military Concepts; Values, Ethics, Culture, and Religion; Wars/Military Involvement; Wars/Military Involvement: Contemporary; Weapons Systems and Weapons Contractors. Some entries appear in more than one category.

T

TACTICS, AIR

The tactics of air war are the techniques and procedures of aircraft employment against targets in the air, on the ground, and in the water. Such tactics will generally reflect the universal traits of air power: its speed, range, flexibility, and ability to mass power. Military operations at the tactical level are executed as missions. These may be broadly categorized as strategic bombardment, counter-air (offensive and defensive), air interdiction, close air support (CAS), airlift, and reconnaissance. Each mission is governed by a unique and dynamic subset of tactics that is linked to the technology of air warfare and is continually evolving in a response/counterresponse manner. In the modern era, tactics have been shaped as much by the electronic environment in which air warfare takes place as by the aerodynamic qualities of aircraft. Many tactics, however, have stood the test of time, remaining fundamentally unchanged since their first employment in World War I.

Early Thinking on Air War

Serious thinking about the optimal employment of aircraft followed closely behind their first use in the air battles of World War I. Based on trial and error and the rapidly expanding series of air missions, pilots took it on themselves to draw up the specific tactics and procedures of air warfare. Remarkably, many of these rules remain valid to the present day. For example, the element of surprise—a dominant factor then and now—has historically accounted for some 80%

of air-to-air kills. Therefore, a time-honored rule of close combat has been to mask the attack by coming out of the sun, employing camouflage, and using

An air-to-air left-side view of a flight of four F-5 Tiger fighters flying in a finger-tip formation over Monument Valley.

Source: Technical Sergeant Bob Simons (released).

smokeless engines. Today, the rule remains valid but, in light of radars and missiles, has been supplemented by further instruction to maintain electronic silence and employ low-observable shapes in fighter design.

Strategic Bombardment

The tactics of strategic bombardment have undergone several changes over the life of the bomber. Whereas bomber operations from World War I through the Korean War generally involved groupings of up to 1,000 aircraft to provide mutual support against defending fighters and achieve the desired target destruction, the advent of missile defenses of the sort that famously brought down a high-flying U-2 reconnaissance aircraft over the Soviet Union put an end to the mass bomber formation. Cold War era tactics saw bombers operating at low level, singly or in loose pairs, as part of the Single Integrated Operations Plan. The destructive power of nuclear weapons obviated the need for

large bomber formations, and the change in tactics from the *engagement* to the *avoidance* of enemy air defenses made large groupings of aircraft tactically unsound.

Bombardment in the Post-Cold War Era

The end of the Cold War reduced the importance of the strategic nuclear war and resulted in a temporary cut of defense expenditures, while concomitantly redirecting the bomber force toward conventional missions. The 1990s Northrop B-2 stealth bomber possessed a comprehensive nuclear and conventional bombing capability, of which the U.S. Air Force only purchased 21. Existing bomber aircraft, such as the B-52 and B-1B, were upgraded to include Global Positioning System, LITENING or SNIPER XR targeting pods, and precision-guided munitions, allowing these former nuclear bombers to conduct a variety of missions on the modern battlefield. The campaigns in Afghanistan (Operation

U.S. Air Force Major General Ken DeCuir, director of aerospace operations for Air Combat Command, fires an AIM-120 advanced, medium-range air-to-air missile from a Missouri Air National Guard F-15 Eagle fighter, 131st Fighter Wing, 110th Fighter Squadron, Saint Louis, Missouri, at an aerial target drone during a Combat Archer mission over the Gulf of Mexico on July 21, 2005.

Source: U.S. Air Force photo by Master Sergeant Michael Ammons (released).

Enduring Freedom) and Iraq (Operation Iraqi Freedom) saw the widespread use of bomber aircraft in precision support of friendly troop movements. What is more, as part of this remarkable transformation, the bomber has evolved to match the special needs of low-intensity operations, acting as airborne firepower arsenal ships and even as CAS aircraft, by way of Global Positioning System–based precision munitions.

Counter-Air Missions

Counter-air missions are flown by fighter and strike aircraft. This section focuses on the air-to-air fighter. The fighter is properly considered a platform by which weapons may be brought to bear against an opponent. To a great extent, weapons drive tactics because the particular characteristics of a weapon need to be met—for example, an aircraft having to maneuver to a position behind an enemy aircraft in order to bring forward-mounted guns to bear—for a

shot to be taken. Those same characteristics must be denied the enemy aircraft to prevent it from taking a shot. The tactics of air-to-air combat have therefore evolved to keep pace with radar and long-range air-to-air missiles, but the fundamentals of basic fighter maneuvering, or dogfighting, remain as valid today as when they were first articulated during the World Wars by Max Immelman, Oswald Boelcke, John S. Thach, and others.

The World War I-era Immelman turn, split-S, and barrel roll are familiar to all modern-day fighter pilots. Other maneuvers have been modified to account for the significantly greater power of contemporary fighter designs. For example, the Scissors maneuver—a sequence of break-like turns between two opponents aiming to force the other into the front—remains a recognized technique, but it is today also practiced in its Vertical Scissors variant, suited to modern fighters' superior climbing abilities. Indeed, fighter combat is far more vertically oriented today than it was in the piston-powered era.

A Soviet-built MiG-29 Fulcrum fighter flown by Major Peter Meisberger, from Germany's 73rd Fighter Wing, Laage Air Base, Germany, fires a radar-guided AA-10 "Alamo" short-burn air-to-air missile at a QF-4 "Rhino" full-scale aerial target drone during a live-fire weapons training mission.

Source: U.S. Air Force photo by Master Sergeant Michael Ammons (released).

Fighter aircraft fight in formations of a leader and a wingman, with the latter providing support to the former. This pair, or “combat pair,” is the basic fighting unit of air-to-air combat, allowing for mutual support and good situational awareness. The pair may be increased by increments of two to create the “finger four,” devised by Werner Mölders during the Spanish Civil War. In such cases, the formation will consist of a lead element, a second element, and so on. Jet speeds have spread the distances between fighters in a combat formation to accommodate greater turn radii. A “combat spread” may see well in excess of 5,000 feet lateral and 1,500 vertical separation.

Air-to-Air Missiles

Developments in air-to-air missile technology have profoundly influenced fighter tactics. The preferable mode of operation today is to employ medium-range missiles at long ranges and avoidance of close-quarters maneuvering. If that is impossible, then the opponents merge into a dogfight. For decades, the typical close-quarters shot required either a sneak attack from the opponent’s 6 o’clock position or, if surprise was lost, a dogfight, preferably followed by rear-quarters guns or infrared-guided missile shot. The advent of the all-aspect infrared-guided missiles in the 1980s meant that shots could be taken against targets at any angle to the shooter. Today’s technological advancements obviate even the requirement to point the attacker’s nose at a target. Off-boresight missiles, such as the AIM-9X, AA-11, IRIS-T, and others, used in conjunction with helmet-mounted cueing systems allow shots at targets flying parallel or, in some cases, behind the shooter. The dogfight of old may truly be at an end.

Air Interdiction

Air-to-ground operations have likewise been affected by radar and surface-to-air operations. The prevalent belief was that coordinated enemy air defenses, spearheaded by a new generation of surface-to-air missiles, had by the 1960s made medium- to high-altitude air operations impracticable. This led to a general and universally accepted push to operations at low altitudes. The key to survival in a modern integrated air defense environment was high subsonic speed at low—below the radar—altitudes, by single or mutually supporting pairs of aircraft. This belief found reflection in designs such as the 1960s-era General

Dynamics F-111 and the 1970s’ Panavia Tornado and Sukhoi Su-24, as well as the 1980s’ Rockwell B-1B strategic bomber. Both the North Atlantic Treaty Organization and the Warsaw Pact adopted low-level tactics and weapons; the British JP233 runway denial weapon and the American LANTIRN (Low Altitude Navigation and Targeting Infrared for Night) low-level navigation and targeting system are the most notable among them.

Low-Level Tactics: Pros and Cons

The actual tactics of ground attack differed significantly between air forces, even within the North Atlantic Treaty Organization. While the Royal Air Force Tornados were expected to operate in autonomous pairs, the U.S. Air Force’s tactical preferences were for strike aircraft to be accompanied by “packages” of defense suppression and electronic warfare aircraft operating with significant fighter top cover. Regardless of the specific tactics, low-level operations presented significant drawbacks. High-speed, night, and all-weather operations in close proximity to the ground were dangerous in and of themselves. Contact with terrain was assuredly lethal, but the denser air at low altitudes and the physics of terrain following flight also reduced range, increased crew fatigue, and presented the challenges of acquiring and hitting the target. Low-level operations were spectacularly demonstrated by Argentine forces during the 1982 Falklands War, but such operations resulted in bomb-fusing problems and cost the lives of a number of pilots who simply flew into the sea. Although the low-level arena remains valid in certain situations, it is today no longer the preferred method of operation.

The introduction of Airborne Warning and Control System surveillance aircraft and the widespread proliferation of fighters equipped with look down/shoot down capability took away the low-level sanctuary for strike and bomber aircraft. The growing low-level capability of surface-to-air missiles and radar-directed anti-aircraft artillery, powerfully demonstrated during the 1973 Yom Kippur War, highlighted the need to actively engage and peel back the enemy’s integrated air defense system. Aircraft specially designed for the suppression of enemy air defenses, popularly known as “wild weasels,” entered service with the U.S. Air Force and Navy during the Vietnam War and have remained a vital component of air war operations. It is rare for a

A pair of British Royal Air Force GR-1 Tornados cruise over Kuwait near the Iraqi border as part of the Southwest Asia buildup in 1998.

Source: PH2 (NAC) Jeff Viano, U.S. Navy.

U.S. Air Force strike package today to enter a combat area unaccompanied by F-16C Wild Weasels armed with the HARM antiradar missile. Electronic support aircraft, such as the Grumman EA-6B and Boeing EA-18G, employ myriad electronic spoofing measures to disrupt radar and communications networks. Developments in electronic warfare usefully illustrate the challenge and response nature of tactics development. Even as the door to the low-level sanctuary shut closed, measures were put in place to return safely to medium- and high-altitude operations.

Impact of Stealth

The real revolution in the conduct of air war came with the introduction of low-observable, or stealth, aircraft that could operate unimpeded in almost any defense environment. The highly secretive effort to develop stealth aircraft, begun in the mid-1970s, bore fruit in the shape of the F-117 strike fighter. The F-117 fused stealth technology,

precision-guided munitions, and sophisticated day/night sensors to negate the defenses that were threatening to shut down closed tactical fighter operations. Stealth revolutionized the tactics of air war, setting them back in some sense to the preradar and premissile “big sky” environment of the 1920s and 1930s. Stealth has proven so successful that every subsequent new U.S. fighter and bomber design has incorporated low-observable characteristics as a primary design requirement.

Close Air Support

The mission of supporting troops in enemy contact, know as CAS, remains an important, if controversial, part of air force capabilities. The challenges of separating friendly from enemy troops in close contact dictate that this mission be carried out in close coordination with ground controllers. In the U.S. Air Force, CAS is performed by the purpose-designed Fairchild A-10 of 1970s vintage but can be provided reasonably well by any modern fighter-bomber or

appropriately equipped heavy bomber. The A-10's GAU-8 seven-barrel 30-mm Gatling gun serves as an effective, accurate, and cost-efficient CAS weapon. The A-10 has seen its operations evolve from low-level pop-up and shoot tactics over Central Europe to the medium-altitude tactics seen in the Afghanistan and Iraq campaigns. Indeed, the change is reflected in the A-10's abandonment of its lizard green paint scheme, designed to conceal it at low levels, in favor of a light grey scheme more suitable to concealment at altitude. The A-10 operates in pairs for mutual support and survives in the dangerous environment of CAS due to its combination of good cockpit visibility, maneuverability, armored protection for pilot and vital systems, and a structure able to absorb damage.

Impact of Technology on Air War Tactics

Technological advances, made apparent during the 1991 Persian Gulf War, have seen a significant shift toward "precision warfare." It is now taken for granted that one stealthy aircraft, equipped with the appropriate targeting sensors and precision munitions, can achieve the destructive effect of hundreds of World War II-era heavy bombers. This assessment broadly holds true even in comparison with the Vietnam era, where dozens of fighter-bombers and support aircraft might have been needed to achieve the same effect. The consequences for air warfare have been profound. Heavy bombers using Global Positioning System-guided munitions can now conduct CAS from 30,000 feet with precision measured in feet, not city blocks. Fighter-bombers that once might have been used against battlefield targets such as troop convoys can now, in their stealthy guise, enter even the most defended enemy airspace and strike strategically valuable targets with remarkable precision.

The effect of all this has been to diminish the divisions between bomber and fighter, strategic and tactical. Technology has at once enabled and forced—due to its high cost—aircraft to take on many roles, employing many tactics. As this convergence continues, the introduction of unmanned combat aerial vehicles will further muddle the tactics of air-to-air and air-to-ground combat. It seems likely that unmanned combat aerial vehicles will continue to supplant the manned fighter, as they have already largely done in the field of aerial reconnaissance.

TACTICS, COVERT

Covert tactics or actions are developed to influence foreign governments, organizations, persons, or events in support of the foreign policy objectives of the United States, while keeping secret the U.S. government's support. Covert actions differ from clandestine ones, the latter referring to the tactical secrecy of an operation; covert means the identity of the sponsoring government is secret or not acknowledged publicly. Covert tactics include propaganda, also known as psychological warfare; economic operations; political support; and paramilitary activities, which until 1976 included political assassinations. Since the September 11, 2001, attacks, covert tactics also have included renditions, cyberwar, and the use of unmanned aerial vehicles (UAVs) or drones. Under the National Security Act of 1947, the Central Intelligence Agency (CIA) has been the lead agency in carrying out covert actions. The president always had been made aware of large-scale operations, but since 1974, all covert operations require the written approval of the president (called "presidential findings"), and the Intelligence Act of 1991 states that the president is the final authority and no findings can be signed retroactively.

Background

In response to the Nazis' advance through Europe, President Franklin D. Roosevelt created the Office of the Coordinator of Information and appointed William J. Donovan as director in 1941. The next year, the Office of the Coordinator of Information became the Office of Strategic Services. The Office of Strategic Services not only collected and analyzed strategic information but also engaged in what is now defined as covert activities—propaganda, political and economic operations, and paramilitary actions behind enemy lines.

The Office of Strategic Services was dissolved in 1945, but unstable political conditions immediately following the war saw the USSR become a dominant threat to U.S. security. President Harry S. Truman signed the National Security Act of 1947, establishing the National Security Council and the CIA.

The CIA focused on the emerging threats of the USSR by collecting and analyzing data. A covert psychological warfare operation to counter communist propaganda in Europe began. Authority to undertake covert action was provided by the catchall phrase “other functions and duties” in the National Security Act.

Varieties of Covert Tactics

Propaganda is referred to as psychological warfare, or “black” propaganda, when used covertly and attributed to someone else. Propaganda, which makes up about 40% of covert actions, can take the form of information in newspapers, television and radio broadcasts, and other printed materials. Two of the first successful CIA propaganda missions took place during the 1948 elections in Italy and Greece.

Economic tactics have traditionally constituted only 10% of covert activities. These have included depressing the world copper price and inciting labor strikes against the Chilean president Salvador Allende in the early 1970s.

Political tactics, used about 30% of the time, include financial support to leaders and creating and/or supporting insurgencies. For example, funds and advice went to Poland's Solidarity movement in 1981 and 1982. The CIA has been involved in at least six coups d'états: the 1953 overthrow of Iran's government, Guatemala in 1954, the Dominican

Republic in 1961, the 1963 army coup in South Vietnam, a failed coup in Chile in 1970, and another coup in Chile that toppled Allende in 1973. Additionally, the CIA was involved in political actions in Grenada, the Philippines, Panama, and Haiti.

Paramilitary tactics often coincide with political tactics. The CIA National Clandestine Service's Special Activities Division (SA) provides training, supplies, and leadership assistance to local groups that carry out sabotage missions as well as actual combat operations. Sabotage can include cutting communication lines, placing bombs, spoiling gasoline reserves, and damaging food supplies. Over the decades, the CIA has supported conflicts and guerrilla actions in at least 26 publicly identified countries.

Renditions tactics refer to the abduction of individuals wanted by the United States but who live in or must be captured in a country where the United States cannot or chooses not to legally apprehend them. Although used in the past, after September 11, President George W. Bush authorized a program known as GST. This permitted capture of al Qaeda officials with the help of foreign intelligence services, the operation of secret prisons (“black sites”), and harsh interrogation techniques, which could include torture such as waterboarding. In some renditions, the United States did not retain custody but instead sent a terrorist to his or her home nation, where some were subjected to torture. Secret prisons or “black sites” in eight countries have held others. In 2009, President Barack Obama signed an executive order to continue renditions but pledged oversight and monitoring of interrogations to avoid torture.

Cyberwar tactics use the ability to penetrate computers or networks in order to cause damage or disruption. These tactics can include everything from transferring funds from a terrorist's bank account to implanting malware to disrupt or destroy operational systems.

UAVs, or drones, were first used for intelligence gathering but, starting in 2002, have been carrying missiles for attacking suspected terrorists, groups, and facilities.

Covert Actions Since 1989

Afghanistan

In 1998, the CIA sent teams and money into northern Afghanistan to persuade the Northern Alliance to capture Osama bin Laden. By 2001, the CIA was air-dropping weapons and supplies for the supporters of Hamid Karzai, a popular exiled tribal leader (who would later become president of Afghanistan) who was organizing resistance against the Taliban from Pakistan. The SA moved throughout the southern areas in attempts to entice other tribal leaders to join the opposition.

After September 11, 2001, President George W. Bush signed a presidential finding authorizing the assassination of Osama bin Laden and others in al Qaeda and the Taliban regime as part of the Global War on Terrorism. By late September, about 10 CIA operatives entered Afghanistan with more than \$3 million for the Northern Alliance to help fund combat preparation, for daily operation of their intelligence group, and for humanitarian aid to civilians near battle zones.

The SA quickly created and trained Afghan commando teams located around the country in CIA bases (usually shared with U.S. special operations forces). They conducted surveillance, raids, “snatch-and-grab” operations against insurgent leaders, and other sabotage.

In early October 2001, the first armed Predator drone missiles were used over Afghanistan. Missiles from drones continued and have become one of the main tactics used to kill Taliban and al-Qaeda members, especially in the remote areas of Afghanistan and neighboring Pakistan.

Iran

In recent years, the CIA has used propaganda and given millions to exiled and paramilitary groups. Efforts at sabotage have included planting faulty parts in nuclear power systems and triggering imported power supplies to explode. In 2007, a presidential finding authorized financial and other support to dissident groups within Iran. In 2010, an extremely complicated computer worm called Stuxnet attacked centrifuges in a top secret Iranian nuclear facility as part of “Olympic Games,” a cyberwar project started in 2006 under President Bush. A secret Israeli agency, along with the National Security Agency and possibly the CIA,

were involved in this cyber attack. More recently, the malware Flame has infected Iranian computers and spies by collecting data, documents, recorded conversations, and keystrokes. No agency or nation has admitted their involvement with Flame, but the United States and Israel are suspected to be behind these attacks as well.

Iraq

Five covert tactics—propaganda, economic tactics, political actions, paramilitary actions, and UAVs or drones, were used during the Persian Gulf War and the years afterward. In January 1991, President George H. W. Bush signed three presidential findings. These permitted propaganda, such as radio broadcasts of the Voice of Free Iraq, assistance to the U.S. Army Special Forces in supplying and supporting resistance forces in Kuwait, covert aid to rebel groups inside Iraq, aid to Kurdish groups to instigate a “rolling coup” in their territory, and economic injunctions that would dishearten citizens and encourage the assassination of Saddam Hussein by encouraging dissatisfied guards in mounting a palace coup. Another presidential finding authorized \$30 million for additional propaganda broadcasts and for organizing a coup involving military leaders and opposition groups.

In 1992, the CIA dumped counterfeit money throughout Iraq to exacerbate a preexisting severe inflationary cycle. The Iraqi National Congress received funding for broadcasting anti-Saddam Hussein propaganda on radio and television stations, the printing of booklets, and dropping leaflets over cities by using CIA-supplied UAVs. The Iraqi National Congress distributed a fake issue of the newspaper *Babil*, which reported the truth about Saddam’s atrocities. Unfortunately, these efforts led to increased fear, not rebellion. Subsequently, SA established a base near the Turkish border and supplied light weapons and training of guerrillas. Plans for an early March 1995 attack on the Iraqi garrisons at Mosul and Kirkuk were to include thousands of Kurdish guerrillas and men from the Iraqi National Congress and the Iraqi Communist Party. After discovering that Saddam’s men had infiltrated the group, the CIA withdrew its air cover and support.

In early 1996, President Bill Clinton signed a presidential finding for weapons, training, and other equipment. By June, however, Saddam’s forces had

arrested and executed more than 100 people, and after a Kurdish group changed sides allowing Iraqi troops to move into northern Iraq, CIA operatives had to flee the country. All in all, between 1991 and 1996, the CIA spent about \$100 million on attempts to oust Saddam Hussein.

Libya

In early 2011, President Obama signed a finding allowing for weapons, money, and other paramilitary support for opposition groups that eventually captured and killed the Libyan president Muammar Qaddafi in October 2011.

Pakistan

In 1999, the CIA trained and supplied about 60 members of Pakistan's Directorate for Inter-Services Intelligence to capture or kill Osama bin Laden, but the mission was abandoned when the prime minister was ousted by a coup. In 2004, the CIA began sending armed Predator drones into a remote region, the Federally Administered Tribal Areas, where al Qaeda members hid under the protection of the Taliban, who use this area to launch attacks against U.S. and other troops in Afghanistan. The use of "signature strikes," in which the CIA attacks targets based on patterns of suspicious behavior and locations, rather than identified individuals, has been successful. By January 2010, more than half of the most wanted terrorist suspects had been killed by armed drones. However, a more recent study shows at least one-third of those killed, or nearly 1,000, have been innocent children and civilians, often including first responders who are hit in a "double strike." The use of drones continues to be a controversial subject.

Serbia

In May 1999, President Clinton approved a finding for teaching sabotage tactics to Kosovar rebels acting against the regime of the Serbian president Slobodan Milosevic. In addition, the CIA employed cyberwarfare and disrupted Milosevic's foreign bank accounts.

Somalia

In 2005 and 2006, the CIA financed secular warlords in a mission to capture al Qaeda operatives, but war with Ethiopia ended the operation. In 2011, the CIA was using mercenaries to train Somalis against

a group with al Qaeda ties. The CIA maintained an underground interrogation center in Mogadishu for suspected jihadists abducted from other countries.

Syria

Since early summer of 2012, CIA operatives have been in southern Turkey, observing the flow of weapons and supplies into Syria from various countries. This is to prevent arms from reaching al Qaeda or other terrorist groups. In August, President Obama signed a finding allowing the SA to be active inside Syria in support of the Free Syrian army. CIA-coordinated airlifts of arms and equipment have greatly increased for those opposing President Bashar al-Assad. The months January 2012 to March 2013 saw at least 85 flights of 50–60 tons per military cargo plane from Qatar to Turkey and on to Syria. In addition to coordinating these supplies, the CIA is assisting in training rebels in weapons use.

Yemen

In 2002, a Predator drone's missile destroyed a vehicle carrying one of the al Qaeda leaders suspected of involvement in the 2000 attack on the *USS Cole*. In 2011, the CIA began employing armed drones over Yemen and, in 2012, requested presidential approval for "signature strikes," because of Yemen's increasing terrorist threat.

Future Developments

The coming years will see an increased use of UAVs. Besides their high success rate, drones eliminate the imperiling of U.S. ground forces. Although little practice of cyberwar tactics by the CIA has been confirmed, their use will grow, especially in targeting the movement of finances and as countries like Iran attempt to hide their nuclear programs in fortified underground facilities and pose a threat to U.S. interests and allies.

TACTICS, GROUND FORCES

Ground forces tactics describes the application of a combination of combat elements to defeat an enemy in a battle or in a nonlethal action, such as a small-scale peacekeeping contingency. In ground forces tactics, certain methods are employed to achieve a specific objective. Tactics are used to create an advantage over the enemy and allow the resulting success to be exploited, thereby gaining a decisive victory. Ground forces tactics focus on the technical application of military action and consist of those techniques and procedures used for accomplishing specific tasks within a tactical action. The objective itself, enemy composition and disposition, and other elements such as terrain and weather dictate

which tactics will most effectively and efficiently accomplish the mission. In a conventional battle, tactics rely on a combination of maneuver and fire support to destroy and defeat the enemy. In nonlethal operations, such as peacekeeping or humanitarian assistance missions, the tactics may be as simple as providing a secure environment in which to deliver food supplies.

Basic Tactical Tenets

Ground forces tactics can be described as the combination of an art, the creative application of military force to a given situation, with a science, the technical application of combat power. To accomplish a particular tactical objective, six basic tenets, described below, must be applied:

1. *Achieving a decision:* It is imperative for a successful tactical leader to study the combat environment to develop a clear understanding of contextual events, background, and future possibilities. Considering the various factors of the combat situation, such as the assigned mission, the enemy and its most likely course of action, terrain and weather, the troops and fire support available, and time, the unit leader must identify all possible actions that will achieve the desired result.

2. *Gaining an advantage:* After a decision is achieved, the tactician must work to utilize his or her knowledge and available information about the combat environment to provide a military advantage. One of the most pivotal factors in gaining an advantage is the identification of decisive points and actions that will be used to target enemy weaknesses.

3. *Being faster:* In combat, it is necessary to only act faster than the enemy, not necessarily as fast as possible. A smart tactician must prevent reckless movement, for it will decrease effectiveness against the enemy.

4. *Adapting:* The ever-changing nature of combat requires a tactician to be able to adapt to various scenarios on the battlefield. By remaining flexible and being willing to change as the situation dictates, the tactician can exploit opportunities to mass at the decisive point, continue to surprise the enemy, and capitalize on available combat resources. There are two types of adaptation: anticipation and improvisation.

5. *Cooperating*: Cooperation is defined as the union of self-discipline and initiative in the pursuit of a common goal or objective. It is a component of control. Control can generally be divided into two types: centralized and decentralized.

6. *Exploiting success and finishing*: In combat, gaining the advantage is only one step toward mission accomplishment. The successful tactician capitalizes on each success to aggressively and continuously pursue the enemy's weaknesses and deliver the finishing stroke when the opportunity arises.

In tactical situations, it is necessary for the unit commander to designate a main effort, or the mission central to accomplishing the objective, and the supporting effort, which facilitates the main effort's actions by providing combat support. The main effort is employed to strike at the decisive point, typically massed with a concentration of resources including manpower and fires. The supporting effort provides the main effort with supporting fire. In contrast to tactics based on incremental attrition, tactics in maneuver warfare apply mass through a weighted main effort at the decisive point to attain the objective.

Types of Ground Forces Tactics

Offensive operations, or those military actions taken to pursue, close on, and destroy an enemy, are designed to achieve decisive victory by defeating an enemy. This is accomplished by either destroying the enemy outright or reducing its will to fight to such a level that, in the enemy's perception, continuing military action is no longer feasible.

Offensive tactics are utilized to accomplish one or more of the following tasks:

- Destroy enemy forces, equipment, and resources
- Deceive and divert the enemy
- Deprive the enemy of resources
- Gain information about the enemy
- Fix the enemy in place
- Seize key terrain
- Produce a reaction from the enemy
- Disrupt enemy actions or preparations

Offensive operations are categorized by four principal types, which can occur independently, simultaneously, or in sequence. The application of

each type of operation is driven primarily by the tactical decision-making process of the unit commander. The four types of offensive operations are as follows:

1. *Movement to contact*: This is an offensive operations that seeks to gain or regain contact and develop the situation in relation to an enemy whose general location is known but whose exact location is unknown.

2. *Attack*: An attack is an offensive operation characterized by coordinated movement, supported by fire, and conducted to defeat, destroy, neutralize, or capture the enemy. The foundation of offensive tactics involves the attack, which is designed to destroy or defeat an enemy at a known location. Two types of attack are most common: a hasty attack, or one in which preparation time is traded for speed to exploit opportunity (i.e., a chance contact), and a deliberate attack, or an offensive action characterized by preplanned, coordinated employment of firepower and maneuver to close in on and destroy the enemy.

3. *Exploitation*: This is an offensive operation that follows a successful attack and is designed to disorganize the enemy in depth.

4. *Pursuit*: Pursuit is an offensive operation designed to catch or cut off a hostile force attempting to escape, with the aim of destroying it.

Three phases typically characterize offensive tactical operations: preparation, conduct, and consolidation/exploitation. These phases should not be considered as distinct entities, as there is not always a definable separation between them. The offensive forms of maneuver represent the basic techniques a force conducting offensive operations uses to gain an advantage over the enemy. The decision on the form of maneuver to utilize in an operation is made during the preparation phase of the attack. There are six forms of tactical maneuver:

1. Frontal attack
2. Flanking attack
3. Envelopment
4. Turning movement
5. Infiltration
6. Penetration

Because offensive operations cannot continue indefinitely, defensive tactics will eventually be required to facilitate additional decisive actions. Once a maneuver unit has reached the culmination point of its offensive action, establishing a defensive position may be required. The characteristics of defensive tactics are similar to those of the offense, such as striking when the enemy is most vulnerable and massing at an identified enemy weak point.

Defensive operations may also be conducted to

- gain time;
- retain key terrain or deny a vital area to the enemy;
- counter surprise action by the enemy;
- economize force, allowing combat power to be concentrated elsewhere;
- increase the enemy's vulnerability by forcing him to concentrate his forces;
- attrite or fix the enemy as a prelude to offensive operations; or
- prepare to resume the offensive.

Defensive positions are formed either hastily, organized while engaged with the enemy or when time is limited, or deliberately, when contact with the enemy is not imminent and can be fortified and developed in depth.

In the defense, there are seven forms of maneuver that a unit may utilize to accomplish its objectives:

1. *Battle position*: This defense position is established with an orientation toward the most likely enemy avenue of approach from which a unit may defend or attack. The battle position can be used to deny or delay the enemy the use of certain terrain or an avenue of approach.

2. *Strongpoint*: It differs from a battle position in that it is designed to be occupied for an extended period of time; the strongpoint defense is a fortified position created to deny the enemy access to terrain and prevent the enemy's use of a specific avenue of approach.

3. *Sector*: This defensive position is a control measure used by a larger unit that allows freedom of action to subordinate units. The principal benefit of this defense is that it allows for decentralized execution, which is synchronized with the higher unit's intent.

4. *Reverse slope*: Organizing a defense on the slope that descends away from the enemy allows the main defensive position to be masked from enemy observation and direct fire by a topographical crest.

5. *Perimeter*: A perimeter defense is oriented in all directions and allows a unit to use this form of maneuver to accomplish a specific mission, such as to defend friendly infrastructure (e.g., military base, air strip) or to provide immediate self-protection, such as during resupply operations when all-around security is required.

6. *Linear*: A linear defense facilitates interlocking and overlapping observation and fields of fire across the unit's front, with the majority of the unit's combat power well forward of the position. In this type of defensive maneuver, sufficient resources must be available to provide adequate combat power across the frontage to detect and stop an attack.

7. *Nonlinear*: Used when the enemy's firepower and mobility are assumed to be equal to those of the defending unit, the nonlinear defense provides the most decentralized and dynamic defense option for units. This type of defense is almost exclusively enemy oriented and is not well suited for retaining terrain.

Evolution of Ground Forces Tactics

Tactics have existed in some form since organized ground warfare began. Recorded military history began with the Battle of Kadesh, pitting one force against another in an open battlefield. This style of warfare, in which an opponent uses sheer numbers and combat power to overwhelm his enemy, has defined ground combat for millennia. Sometimes, using superior tactics and unfamiliar techniques, a numerically inferior force could triumph. This was the case for the Greeks at the Battle of Marathon, where they defeated a larger Persian ground force. It continued through U.S. history, including major land battles of the Civil War in which opponents pitted force against force on the open ground. However, the evolution of such attrition style of combat gave way to superior tactics, which gave an advantage to the unit with the best ability to adapt, mass forces at the decisive point, and maneuver against the enemy. General Stonewall Jackson succeeded in using these methods at the Battle of Chancellorsville, where he flanked a larger Union army and annihilated the numerically superior opponent. The transition

from attrition to maneuver warfare gave the tactically superior force a significant advantage over the static enemy, and using the principles of warfare, the unit with the best ability to maneuver could rely on tactics instead of brute force to defeat an opponent. Modern infantry tactics allow a unit to utilize mass, surprise, and mobility to target and exploit an enemy's weakness. Maneuver warfare now dominates modern ground force tactics.

In contemporary warfare, militaries find themselves involved in several types of operations, ranging from full-scale combat to small-scale contingencies, such as peacekeeping operations and humanitarian assistance missions. In each of these, modern armies are required to employ the same principles and tenets of ground tactics, although the "enemy" in operations other than combat may not be clearly defined. In those missions, the military still seeks to exploit the advantage, perhaps by establishing secure zones for humanitarian agencies to successfully complete their objectives. In Operation Iraqi Freedom, for example, the U.S. military deployed into Iraq with a clearly defined combat mission and engaged in an international armed conflict against the Iraqi armed forces. After vanquishing the enemy, the mission transitioned into a peacekeeping mission, which required supporting local law enforcement and national military units to secure the country and provide order for the citizens of Iraq. During both types of missions, the U.S. military was required to provide humanitarian assistance as well, in the form of providing potable water, medical care, or rebuilding local infrastructure. In each of these missions and operations, the military employed the basic tenets of tactics, achieving a decision and carrying it through to completion.

Although it has existed for thousands of years, irregular warfare has received significant attention in recent years, as military operations have shifted from conventional, force-versus-force battles to asymmetric tactics involving civilian populations. This form of protracted warfare, known as irregular or hybrid warfare, is defined in the Department of Defense's 2010 document *Irregular Warfare: Countering Irregular Threats Joint Operating Concept* as a "violent struggle among state and non state actors for legitimacy and influence over the relevant populations" (p. 9). Irregular warfare favors indirect and asymmetric approaches, though it may employ the full range of military and other capabilities to erode

an adversary's power, influence, and will. This "modern" form of warfare typically pits subnational or nonstate actors against conventional forces in a battle for control over the local population. Tactics in these fights involve extensive interaction with civilians, law enforcement operations, economic development, and information operations. The enemy typically employs a hybrid of irregular, disruptive, catastrophic, and traditional capabilities as a way to achieve strategic objectives. Although irregular warfare is not a new concept or collection of tactics, many top military and civilian leaders agree that irregular warfare will be the domain in which the United States and its allies will engage threats in the 21st century.

TACTICS, NAVAL

Naval tactics are maneuvers and procedures used by warships to accomplish their assigned missions. Guided missiles and aircraft greatly influenced and

changed naval tactics in the latter half of the 20th century. Naval tactics can be organized into categories based on the type of opponent being engaged: anti-air warfare, antisurface warfare, and antisubmarine warfare. Naval tactics are also influenced by the formations, the weather, the electronic environment, the battlespace, and the level of air support available.

Anti-Air Warfare

In anti-air warfare, warships engage enemy aircraft and missiles with the intent of destroying the aircraft and avoiding damage from the missiles. Antiship missiles launched from aircraft represent the most serious threat to modern warships. As such, most warships carry some form of surface-to-air missile for use against enemy aircraft. These missile systems range from handheld weapons such as the American Stinger to long-range missiles that make use of the warship's radar for guidance. Larger warships such as cruisers and destroyers are often equipped with three anti-air weapon systems: a longer range surface-to-air missile; a shorter range surface-to-air missile; and a close-in weapon system, such as an automated defensive cannon. Close-in weapon systems based on gun technology, such as the American Phalanx, are designed to fire thousands of rounds at incoming missiles as they near the targeted warship. When one missile is destroyed, the system automatically searches for and engages additional incoming missiles. Warships also carry decoys, such as radar buoys and rockets carrying chaff, which provides opposing radars with false returns. Warships can also seek the protection of natural radar decoys by closing with islands and rocks if possible. As a last resort, the artillery weapons, ranging in size from 75-millimeter to 5-inch guns, of modern warships can be used to engage enemy aircraft and missiles. However, the slow rate of fire of these guns, in comparison with close-in weapon systems, limits their effectiveness.

Warships are able to make the most effective use of their defensive systems when opposing aircraft and missiles are detected at a significant distance. The distance at which detection occurs depends on the height and power of the warship's radar, the weather conditions, and the height of the opposing aircraft or missiles. Modern antiship missiles are designed to fly close to the surface in order to reduce the distance at which detection can occur. This tactic

is known as "sea-skimming." Aircraft can use land features, such as mountains, to avoid detection by warship radar. To enhance the distance at which detection occurs, warships are often accompanied by airborne early-warning planes equipped with powerful radar systems. These planes allow warships to detect sea-skimming missiles and aircraft at longer ranges. As an alternative to airborne early-warning aircraft, smaller warships can be used as radar pickets, stationed at a distance from a group of warships to provide early warning and detection.

Antisurface Warfare

Historically, the heavy guns on warships were the primary means of inflicting damage on other warships. The advent of modern, guided missiles changed the nature of surface combat between warships. In his book *Fleet Tactics and Coastal Combat*, Wayne P. Hughes argues that gun-centered attrition-style naval battles have been replaced by missile-centered battles based on a series of offensive pulses. Each pulse consists of antiship missiles, perhaps in combination with supporting aircraft. The extensive defensive capabilities of warships against air and missile attack mean that these offensive pulses must have sufficient missile strength for at least some of the missiles to penetrate the warship's defenses and strike the target. To achieve the necessary density of missiles, warships fire their weapons simultaneously in groups to maximize the concentration of missiles. These saturation tactics were used successfully by Argentinean aircraft operating against the British navy during the Falklands War in 1982. The British escorts were able to destroy some of the attacking aircraft, but not before their bombs or missiles could damage the British fleet.

A variation on saturation tactics is the concept of swarm tactics. Swarm tactics begin with the same premise as saturation tactics—that the modern warship requires a sufficient density of attacking missiles to overwhelm its defense. However, swarm tactics call for a dispersal of the attacking missiles onto numerous launching platforms. For example, instead of firing a barrage of missiles from two or three larger warships, a group of 10–15 patrol boats, each equipped with several antiship missiles, would launch from multiple locations against the target. The resulting number of incoming missiles would be the same but would have the advantage of approaching the

target from 10–15 different vectors, increasing the challenge for the warship's defensive systems.

The ever-increasing range of antiship missiles makes targeting a difficult challenge for naval commanders. Missiles, particularly cruise missiles, can strike targets outside the maximum detection range of a warship's radar system. To engage targets at a great distance, warships rely on supporting ships and aircraft serving as scouts to provide targeting information. The warship must be able to securely communicate with the scouting units, highlighting the importance of the electronic battlefield for naval tactics. Communications between warships and scouts can be interrupted by jamming equipment, designed to flood the electronic spectrum with randomly generated signals, often referred to as "noise." Jamming also reduces the performance of radar systems. However, aircraft and ships operating jamming equipment can be located by coordinated search efforts. Once located, these jamming units themselves become vulnerable to attack.

Undersea Warfare

Under the surface, submarines perform many of the functions of surface warships, including escort, trade protection, interdiction, and land attack. Undersea tactics emphasize maintaining a low sound profile, due to the capabilities of modern sonar. Sonar can be used to detect submarines and ships by bouncing a pulse of sound waves off their hulls and measuring the time required to travel between the two units. This is called active sonar. Passive sonar involves listening for the sounds given off by submarines and warships that are transmitted through the water. The engine sounds are usually the first to be heard and at the greatest distance. Passive sonar can detect opposing units at a greater distance than active sonar. As a result, submarines, especially submarine engines, are designed to be as quiet as possible to avoid being detected first. Submarines equipped with nuclear engines, while capable of higher performance than diesel engine submarines, are at a disadvantage in remaining quiet due to the continuous cooling operations of modern nuclear reactors.

Submarines can try to hide their sound profiles by traveling slowly at greater depths. After detecting their target, submarines maneuver into a favorable firing position, seeking to minimize the potential for detection by the enemy. Underwater currents create

"flow noise" as water with a certain temperature and speed moves past water with a different temperature and speed. Torpedoes are the standard weapon used against submarines and can be guided to their target if equipped with wires. Wire-guided torpedoes trail a wire connecting the torpedo to the launching submarine, enabling the submarine to maintain control of the weapon after it is launched. When the target ship detects the torpedo and begins evasive maneuvering, the torpedo's speed is increased, and the weapon can be steered toward the target. At this point, submarines can also deploy noisemaking devices in an effort to confuse the acoustic sensors on torpedoes.

Larger surface warships also carry torpedoes, which can be launched directly into the water or deployed at a distance from the warship by attaching a rocket motor to the torpedo. Helicopters play an important role in antisubmarine warfare since their approach is difficult for submarines to detect. Helicopters use sonar buoys equipped with active sonar as well as sonar equipment that can be lowered into the water and raised again. Once their target is located, helicopters can drop a torpedo equipped with a parachute.

Formations and Battlespace

Warships typically operate in groups to provide mutual support and mutual protection. Electronic data links allow warships in a group to share information, enhancing the effectiveness of their defensive systems. Since World War II, the most important warship in a group, often an aircraft carrier, is placed at the center of a rough circle of escorting warships. The design characteristics of antimissile missiles shape the effectiveness of this circular formation. These defensive missiles are most effective when engaging targets heading directly for the ship launching the antimissile missile. As a result, escorts in a circular formation are most effective in engaging antiship missiles at a distance, where the incoming missile appears to be heading for every ship in the formation. While the circular formation is common, warships sometimes operate at a distance from a group of friendly ships. This tactic could be used to extend radar coverage, to keep opposing ships away from higher value targets, or to operate in shallower waters.

The battlespace is the physical area within which naval combat takes place, and it is defined by the area within which a naval commander can detect

and defeat enemy forces. In open waters on the world's oceans, the battlespace is limited only by the range of weapons, radar, and sonar. Closer to shore, geographic features, such as islands, shallow waters, and undersea formations, restrict the size of the battlespace. Since many naval operations are designed to protect sea lines of communication, merchant ships and coastal maritime traffic can also inhibit the battlespace.

Unconventional Warfare

Since the end of the Cold War, the frequency of unconventional naval operations has increased. The 1998 attack on the American destroyer USS *Cole* highlights the danger posed to warships by small boats equipped with explosives, especially in harbors. More recently, warships from navies throughout the world have been deployed off the coast of East Africa to protect maritime shipping from attacks by Somali-based pirates. These operations highlight the reactive and adaptive nature of unconventional warfare. When the naval patrols began near the coast, pirates began to utilize support ships to operate farther out to sea. When pirates began holding merchant crews hostage, navies used special operations teams to recapture merchant ships under pirate control, and some shipping companies hired private security personnel.

TAIWAN

Taiwan is a mountainous subtropical island located in the West Pacific Ocean, between the East China Sea and the South China Sea, separated from mainland

China by the 180-km-wide Taiwan Strait. The island, with a land area of approximately 36,000 square kilometers, has 23 million residents. New Taipei, Kaohsiung, Taichung, and Taipei are the four largest cities, and Taipei is the capital. This entry describes the historical background and current state of the East Asian island.

From European Colonization to Japanese Colonization: 1624–1945

Early Portuguese sailors called Taiwan “Ilha Formosa” (beautiful island). The Dutch came to this island in 1624, when it was inhabited by Austronesian aboriginal peoples and Han Chinese. Spaniards arrived in 1626 to colonize northern Taiwan, but the Dutch ousted them in 1642. In 1662, Admiral Zheng Chenggong (Koxinga), a loyal Ming Chinese general, expelled the Dutch and started to rule the island. Zheng’s regime surrendered to Qing China after a sea battle off Penghu (Pescadores) in 1683. Taiwan became the official name of the island when the Qing Empire annexed it in 1684.

In 1874, the Japanese landed in southern Taiwan and defeated the native resistance. After China sent reinforcements to Taiwan and the British minister’s mediation in Beijing, the Japanese invasion army withdrew. From 1884 to 1885, French troops attacked northern Taiwan but failed to defeat the Chinese defenders. After these foreign encroachments, the Qing court established Taiwan as a province of China and chose Taipei as its provincial capital.

The Qing court tried to modernize Taiwan. However, Japan defeated the Qing Empire and forced Beijing to cede Taiwan in 1895. The Japanese ruled Taiwan as a colony for 50 years until 1945. The colonial government laid the foundation for Taiwan’s modernization by enforcing compulsory education, providing the necessary infrastructure, starting a public health service, and promoting agricultural and industrial development. Taiwan was used as the Japanese base for military operations to conquer Southeast Asia during the Second World War. After the war, Taiwan was restored to the Republic of China (ROC) in October 1945.

Taiwan After 1945

Taiwan was made a province of the ROC, founded in 1912 after the Qing Empire had been toppled. President Chiang Kai-shek moved the ROC

Map of Taiwan.

government to Taipei after the People's Republic of China (PRC) was proclaimed in Beijing in 1949. A battle was fought at Guningtou in October 1949

on the offshore island of Kinmen (Quemoy), which was under the control of the ROC (Taiwan). The People's Liberation Army (PLA) lost the battle and

gave up the plan to invade Taiwan. The Korean War occurred in 1950, and the PRC shifted its attention from the Taiwan Strait to the Korean Peninsula.

After the end of the Korean War, the United States signed a mutual defense treaty with the ROC in 1954. The First Taiwan Strait Crisis occurred in the same year. The PLA began to bombard Kinmen on September 3, 1954, and took over some other offshore islands controlled by the ROC in 1955. The Second Crisis occurred on August 23, 1958, when the PLA's shore batteries bombarded Kinmen again. The artillery duel that followed lasted for 44 days. The PLA also engaged with the ROC's navy and air force during this crisis.

An undeclared truce has been in place after the Second Taiwan Strait Crisis. The economy took off, and Taiwan became an industrial society during the presidency of Chiang Ching-kuo, Chiang Kai-shek's successor. Under President Jimmy Carter, Washington cut off diplomatic relations with Taipei in 1979, but the United States has continued to maintain quasi-official relations with the ROC. Under the Taiwan Relations Act of 1979, the United States continues to provide defensive weapons and equipment for Taiwan's self-defense.

Taiwan started democratization in earnest after 1980. Chiang Ching-kuo initiated a political liberation process, and his successor Lee Teng-hui kept democratizing Taiwan through a series of constitutional amendments during the 1990s. Taiwan became a semipresidential democracy, in which the president is elected directly by the people and the prime minister is responsible to the legislature. The prime minister is appointed by the president. The term of office for the president is 4 years, and the president may be elected for a second term.

President Lee also improved relations between Taiwan and the PRC. In 1991, the PRC and Taiwan (under the name of Chinese Taipei) joined the Asia-Pacific Economic Forum at the same time. Both sides of the Taiwan Strait started to hold quasi-official meetings in 1993. Meanwhile, Taiwan started to accumulate huge foreign exchange reserves with a vibrant electronics industry.

In 1995, Lee accepted an invitation from Cornell University to attend his college reunion. Initially, the administration of Bill Clinton objected to Lee's visit, especially for the precedent it would set since no ROC official from Taiwan had visited the United

States since the Carter administration had normalized relations with the PRC in 1979. But under pressure from the U.S. Congress and over the strenuous objections of the PRC, the Clinton administration relented and granted Lee permission to come to the United States, while stressing his trip was strictly unofficial. The PRC interpreted this as a provocative move. Beijing reacted with a series of massive military exercises, including launching missiles toward the sea near Taiwan's major ports, before the first democratic presidential election in Taiwan. Lee won the election in March 1996.

Chiang Kai-shek, Chiang Ching-kuo, and Lee Teng-hui were all from the Chinese Nationalist Party, known in Taiwan as the Kuomintang, or KMT. Chen Shui-bian, from the Democratic Progressive Party, served as president from 2000 to 2008. From 1995 to 2008, the Taiwan Strait was one of a few hot spots that might ignite a great-power war in the post-Cold War era. As cross-strait relations deteriorated, Taiwan's economic growth started to slow down in the first decade of the 21st century. Thus, sustaining huge financial and human resources for nonproductive military purposes became more difficult than before.

After a decade of military downsizing programs, supported by both the Democratic Progressive Party and the KMT, the ROC's military has decreased to fewer than 300,000 personnel, equipped with weapons such as F-16 fighters and M-60A3 main battle tanks (purchased from the United States), Mirage-2000 fighters and *Frégate classe La Fayette* (purchased from France), and the homemade Indigenous Defense Fighter, protecting Taiwan, Penghu, and some offshore islands near Mainland China, such as Kinmen and Matsu. The ROC also claims sovereignty over the Spratly Islands in the South China Sea and Diaoyu Islands (Pinnacle Islands, or Senkaku Islands in Japanese) in the East China Sea.

In 2008, the KMT won the presidential election again. To reduce tension across the Taiwan Strait and revitalize Taiwan's economy, the Ma Ying-jeou administration negotiated with Beijing to conduct the Economic Cooperation Framework Agreement, and authorities on both sides of the Taiwan Strait signed it in June 2010. The KMT plans to utilize the Economic Cooperation Framework Agreement as a foundation to enhance Taiwan's security and economic interests in the next decade. On January 14,

2012, Ma received nearly 7 million votes and was reelected as president of the ROC.

TANKS

Tanks, the tracked, armored vehicles with large caliber and machine guns now associated with both offensive and defensive combined-force operations in front-line combat, were a technological innovation developed by the French and British armies during World War I in response to the new combat conditions of machine-gun created stalemate of trench warfare. Seen as an adjunct to infantry for many decades, tanks now contribute their mobility and lethality to the integrated battlefield.

World War I

The British Royal Navy Air Service used armored touring cars to protect planes against German cavalry in France and Belgium during 1914. Nautical terms associated with tanks to this day (“crew,” “turret,” “hatch,” “periscope” among others) can be attributed, in part, to interest in “landships” by Winston Churchill, then First Lord of the Admiralty. By early 1915, the British experimented with using caterpillar tracks to move a machine-gun-wielding armored device (called water “tanks” to keep secret their actual purpose) over barbed wire and across

trenches. British Mark I tanks first saw combat in the Battle of the Somme, September 15, 1916. Deployed in small groups, their crews received no training to coordinate with either ground or air forces. Tank enthusiasts claim the Battle of Cambrai (November 19 to December 7, 1917) as evidence of their advantage when deployed as a principal weapon en masse: 300 British Mark IV tanks engaged in a surprise attack along the Hindenburg Line, resulting in an initial gain of territory along a 7-mile stretch with only 4,000 Allied men lost and 7,000 Germans captured. The future U.S. Army general George S. Patton used armored Dodge touring cars in a 1916 raid against Pancho Villa's troops in Mexico, thus claiming to be the first American to use an armored vehicle in combat. By the fall of 1918, the U.S. First Brigade, under the then captain George S. Patton, would train with French Renault light tanks and engage in the Meuse-Argonne Battle as support for infantry.

Crews of British tanks as well as French Renault light tanks faced numerous dangers: lack of communication between tanks and with other forces, overheating and fire, exhaust fumes, and breakdowns on either side of the line. The U.S. Army corporal Henry Edwin Bianchi, in France in 1918, reports in his diary that American crews called tanks “crawling coffins.” The tanks drew so much enemy fire that infantry, far from seeing them as adjuncts, grew hostile to their appearance.

Interwar Developments

After the war, the disappointing performance of tanks when used in small groups by infantry commanders who expected them to perform in rugged or muddy terrain caused many to dismiss them as mere support for the infantry or, even more surprising, horse cavalry. A few visionaries (John Frederick Charles Fuller in Britain, Heinz Wilhelm Guderian in Germany, Patton in the United States) saw the potential of tanks to be used in large numbers combined with—rather than in support of—infantry and coordinated air power; several decades passed before the infantry-centric doctrine was overcome in the United States. As a result, the United States entered World War II with the lightly armored, but fast, medium Sherman tanks. Designed to support infantry, its 74-millimeter main gun's short 10-foot barrel had a low muzzle velocity, making it a poor match for the German Panzers.

Tank ploughing its way through a trench and starting toward the German line, during World War I, near Saint Michel, France.

Source: National Photo Company (Courtesy of Library of Congress).

During the Russian Civil War, the Red Army not only captured French Renault light tanks and British Mark V heavy tanks and Whippet light tanks issued to the White Army but also began to develop a Soviet-designed tank based on the French Renault. Later called the KS (Krasno-Sormovo), the first Soviet tank, with armor and firepower comparable with the Renault, was named “Freedom Fighter Comrade Lenin” on December 1, 1920. In 1922, as a result of combat experience, 15 KS tanks were produced, which for the first time carried a machine gun and a 37-millimeter gun in the turret. Seen initially as support for infantry, throughout the Civil War the developing Red Army tank forces developed tactics in actual combat and gained experience with rapid flanking tactics and simultaneous multiple sector breakthrough tactics similar to those used by the Allies on the Western front.

During the interwar period, the Russians purchased a variety of light and medium tanks from

British Vickers-Armstrong and chose to model their heavy tank on the Christie, a model rejected by the U.S. Army. The Russian T-28 medium and T-35 heavy tanks of the period were known for mobility and power. In the mid-1930s, Soviet and German mechanized war theories were remarkably similar, emphasizing mobility, surprise, and flexible tactics. However, after failures in the Spanish Civil War, Joseph Stalin purged the Red Army of commanders and tacticians and rejected the efficiency of large, independent armored units. Subsequent defeats in the Finnish-Soviet War (1939–1940) inspired a return to large tank units to be deployed en masse. Although the Soviets gained important lessons about maneuvering through difficult terrain, and sloping armor to increase protection, the reorganization of Russian tank forces would not be effected in time to deflect the impending German invasion.

By 1935, with Adolf Hitler in power, Germany maintained a combined force armored division

of 481 tanks. In contrast, in 1939, the U.S. Army had only 8 medium and 10 light tanks. Although German aircraft development and production would overshadow armored vehicles as World War II progressed, the Wehrmacht benefited from advantages in training and force coordination practiced in the 1939 invasion of Poland.

World War II

In 1940, when Germany turned these tactics (and 2,500 light Panzer I and II tanks) on Western Europe, French forces, focused on the Maginot Line, faced tactical and strategic challenges despite their superior numbers. In many ways, French tanks were superior to their German counterparts, particularly the FT Renault light tank, with innovative fully rotating turrets, and the Char (Renault) D 2, with a powerful 47-millimeter gun. German Panzer divisions also succeeded against

the British Matilda 1 (A11), an infantry support tank with superior armor. German use of advance artillery and airstrikes followed by coordinated attacks by tanks, motorized infantry, and motorized artillery, known as Blitzkrieg, also lent their tanks a reputation for terror. Even during the war in the mountainous Balkans, reports of German Panzers projected an image of invincibility in advance of further evidence.

During the battle for North Africa, German general Erwin Rommel developed new and influential principles of armored warfare, in particular the classic breakout strategy: concentrating force at one weak point to affect a breakthrough, bringing on forces to secure the flanks on both sides, and then quickly penetrating deep into the enemy's rear. However, despite Rommel's practiced use of speed, maneuverability, and surprise, and the addition of Mark III and IV Panzers, Germany's loss of air superiority and logistical difficulties led to its surrender on May 13, 1943.

M4 Tank on the production line, ca. 1942.

Although played out over vastly larger territories, the tank battles of Operation Barbarossa—the German attack on the USSR—were determined by similar matters of supply and reinforcement. Despite the legendary German acquisition of Soviet territory in the summer of 1941, the Germans knew that their Panzer III and IV tanks were outclassed by the Soviet T-34, a highly maneuverable medium tank weighing 33 tons, with 1.8 inches of sloping frontal armor and a 76-millimeter gun. Nazi military leaders' arrogance prior to the invasion caused them to dismiss their knowledge of the Soviet tank, whose armor could withstand the relatively small-caliber rounds from Panzer IIIs and IVs. The German delay in producing heavy tanks, according to Gerhard Weinberg, meant that the new German designs, the Panther and the Tiger, would not appear until 1943. Although the Red Army lost 17,500 out of 24,000 tanks early on, the Soviet factories spread throughout the USSR could produce large numbers of T-34s and, after 1943, the IS (Iosif Stalin) heavy tank. Weighing 47 tons and carrying a 122-millimeter gun, the IS was remarkably mobile, allowing it to coordinate operations where the new models of German tank could only operate independently.

The German Tiger and the Panther exchanged mobility and maneuverability for firepower and armor. With 3 inches of sloping frontal armor, the Panzer V Panther's 75-millimeter 18-foot gun could penetrate the armor of the T-34 as well as the U.S. Sherman tank. The Tiger II's 88-millimeter gun could penetrate the Allied armor at 2 miles. However, delivery of these models never reached the numbers of the Panzer III and IV. Overwhelmed by production and replacement costs (complicated by the use of slave labor), not to mention the lack of raw materials, combined with treacherous weather, vast distances, and shortages in trained crews caused the Germans to fight battles of attrition at Stalingrad and Kursk. While the T-34, like the Sherman tank, was disadvantaged against more highly engineered German models, it could be, and was, mass produced cheaply by highly motivated civilians on the home front, as was the Sherman.

Cold War

In the years immediately following World War II, the Soviet Union deployed large numbers of armored divisions aimed at the Fulda Gap, the most likely

route of a Soviet invasion of Western Europe, causing the United States to continue manufacturing the M26 Pershing tank, a heavy tank developed late in the war. Although only 20 Pershings saw combat in Europe, they deployed in Korea, as did the "Easy Eight," a Sherman with a high velocity 76-millimeter gun. The M48 Patton, a medium tank, served in Vietnam, as did its successor, the M60, the last tank based on World War II technology. While these tanks and British Centurion were given to North Atlantic Treaty Organization Allies, satellites of the former Soviet Union acquired Stalin IIIs (IS-3 or *Shchuka*, a heavy tank developed late in World War II with a 122-millimeter gun capable of firing high explosive rounds) as well as T-34-85s which were produced into the 1950s. In addition, after 1958, the Soviet Union awarded or sold T-55s, a 40-ton medium tank with 4-inch cannon. T-55s had a range of 2,700 yards and modifications to the turret's ventilation in anticipation of nuclear war. Like the U.S. M60, the Soviet T62, produced after 1960, represents one of the last tanks based on World War II technology.

The United States did not deploy a large number of tanks in Vietnam due to the terrain and initial lack of enemy armor fielded by the North Vietnamese army. As the war continued, the North Vietnamese used the Polish PT-76 amphibious tanks as well as Soviet T-54s (capable of river crossings) and the T-59, the Chinese version of the T-54. It was a T-54 that crashed through the gates of the Presidential Palace in Saigon in 1975, signaling the war's end.

During this first phase of the arms race between the United States and the Soviet Union, many lessons were learned through observance of combat in the proxy wars fought in the countries to which each side supplied arms. The Soviet army, having relied in World War II on its vast numbers of T-34s to combat the more highly engineered German Panzers, continued to be guided by the principle "Numbers annihilate," according to Steven Zaloga. The USSR would continue to mass produce tanks that required only a few hours of training to operate. Even for its T-80 and later tanks, armed with guided missile capabilities, cost concerns minimized training. Soviet-trained satellite countries also suffered from lower target engagement skills and an inability to coordinate large unit tactics and interaction with individual crews.

Nowhere was this more evident than in the 1973 October War, also known as the Yom Kippur War. On October 6, 1973, along the Golan Heights,

170 Israeli Shot Kal (a modified British Centurion tank with 6 inches of frontal armor and a 4-inch rifled cannon) were surprised by 1,200 Syrian tanks (Soviet T-62s, T-54/55s, and T-34s) armed with Soviet night fighting equipment including laser range finders. Simultaneously, Egypt launched an attack in the Sinai, with 1,650 T-54/55s, 100 T-62s, and 100 T-34 medium tanks. As the war progressed, Jordan and Iraq supported Syria with both infantry and air power and an additional 420 medium tanks and 900 T-54/55 tanks. The Arabs planned to force Israel into a two-front war of attrition before it could deploy its superior mobile armor capabilities. Instead, at the war's end 12 days later, the vastly outnumbered Israeli forces were within artillery range of Damascus and within 20 miles of Cairo.

One advantage Israel had against Syria, Jordan, and Iraq was the high ground of the Golan, allowing its military personnel to see the approach of enemy tanks. Another factor in Israel's favor was the superior training given to the crews. Despite losing 75 tanks on the war's first day, the Israelis overcame the Syrian crews' night fighting equipment by identifying the laser beams with their night vision binoculars and coordinating responses between their remaining tanks, thus surviving the first night. The Israeli forces' superior targeting and maneuvering skills took advantage of the terrain and enabled them to exploit weaknesses in the capabilities of the T-55s and the Syrian crews.

M1A1/2 Abrams

In 1975, the lessons of the Yom Kippur War influenced the design of the 62-ton M1 Abrams, first produced in 1978. More than 3,000 were produced after 1980. With armor able to withstand virtually any blast as a result of layering of materials (including depleted uranium and Kevlar), the M1's first-strike capabilities were greatly enhanced by a computer-stabilized gun platform that allowed accurate targeting of the British 105-millimeter rifled tank gun (also used in the M60) while on the move. While the M1's top speed was governed to 45 miles per hour, when ungoverned it could reach speeds of up to 60 miles per hour. The increased weight of its successors (6 tons for the M1A1 and 7 tons for the M1A2) has decreased that speed slightly, though power from the 1,500-horsepower turbine engine remains ample. The tanks' cruising range, however, has suffered, dropping from 275 to 265 miles.

In addition to an improved suspension system and a nuclear, biological, and chemical protection system, the upgraded Abrams M1A1, of which 4,796 were built for the U.S. Army after 1985, carried a 120-millimeter cannon with a smooth bore barrel (as does the current M1A2). Among a variety of rounds available for the cannon are high explosive antitank rounds that deploy chemical energy penetrators effective against concrete bunkers and armored vehicles. The charge can be initiated by impact or by a proximity sensor, depending on the operational mode the tank crew chooses. In addition, 45-pound depleted uranium Sabot antitank rounds are also utilized, which deploy kinetic energy for an increased kill probability at greater ranges than the heavier high-explosive antitank rounds. The variety of ordnance, when combined with the thermal imaging system and laser range finder, makes the Abrams the most lethal tank in history.

The Abrams's main gun sight's optical and thermal imaging allows targeting through dust and fog as well as at night. Further enhancing targeting is the computerized stability of the gun platform. Enhanced communication systems allow each member of the crew to relay information about the terrain, increasing coordination within the tank as well as with other forces. In addition to the armored layers, the Abrams's crew also benefits from gun rounds stored in armored ammunition boxes and top panels that blow outward to avoid injury to the crew.

All three tanks in the M1 series also have a 7.62-millimeter M240 machine gun (often called the "coax," short for the term *coaxially*) mounted in-line and aimed with the main gun to kill targets within closer range, especially enemy ground troops. The commander can fire the main gun independently of the gunner in M1A2s. In addition, the commander can fire a 50-caliber machine gun mounted outside the hatch. The loader also fires a 7.62-millimeter M240 machine gun.

Although the M1A1 participated in many North Atlantic Treaty Organization exercises, it went untested in battle until February 24, 1991. During the Battle of 73 Easting in the Persian Gulf War, the 2nd Armored Cavalry Regiment discovered and destroyed two Republican Guard Tawakalna Division brigades even before the bulk of coalition forces arrived to destroy seven other elite Iraqi divisions.

The success of this 90-minute battle established the supremacy of the M1A1. The fact that tanks in

the Persian Gulf War fought at such distances (rarely approaching closer than 2 kilometers) provided evidence supporting the accepted U.S. military doctrine that tanks, even ones so versatile, cannot be used in urban combat. As a result, tank crews continued to be trained to fight in the open desert and improvements to the M1A1 during the interwar period focused on enhancing targeting and armor.

During Operation Iraqi Freedom, in 2003, however, Abrams M1A1s attached to the U.S. Army 3rd Infantry Division played a key role in the April 3–12, Battle for Baghdad, revealing both the effectiveness of tanks in an integrated, albeit urban, battlefield and their surprising vulnerability to asymmetrical warfare. Less surprising was their dependence on maintaining supply lines, particularly those for fuel.

The U.S. victory in 2003 demonstrated the versatility of the M1A1 but again exposed its primary weakness, its poor fuel consumption. With a fuel

capacity of 498 gallons, Abrams are multifuel capable; however, whether they are burning gasoline, jet fuel, or kerosene, they require 1.7 U.S. gallons per mile.

Improvements to the M1A2 are primarily related to electronic awareness and management of the battlefield. Future modifications of tanks will most likely focus on optimizing electronic navigation and situational awareness, as well as cost and fuel efficiency. Enhancing the ability to communicate with other components of combined forces will be increasingly important because the tank's future, as with all armament, will depend on its lethality in situations where air superiority is not as secure as it has previously been for the United States.

TARGETING SYSTEMS

Air, land, and sea military forces use a number of mechanisms, either individually or together, to designate a target for attack, via a process known as fire control, and to guide a weapon toward its target.

Laser, optronic, satellite, radar, and infrared mechanisms are used by the military for targeting. Each of these techniques has advantages and disadvantages. It is for this reason that contemporary armed forces do not use a single targeting process to the exclusion of all others.

Laser Targeting Systems

The process of light amplification by stimulated emission of radiation (LASER) can be used for several targeting system applications, including laser target range finding, laser target designation, and laser weapons guidance.

Laser Target Range Finding

Laser range finding exploits the ability of laser radiation to travel at the speed of light in a straight line. This provides a precise measured distance between the origin of the laser beam and the target it is illuminating. Once this distance has been ascertained, it is possible to decide which type of weapon to employ against this target based on the target's distance and the weapon's range.

Although laser range finders provide precise measurements, their accuracy can degrade over distance. This is because a laser beam radiates in a cone-shaped pattern, that is, the farther the beam travels, the wider its coverage, potentially causing

it to reflect prematurely from other objects in front of the target, such as leaves on plants. This light is then reflected back to the range finder, providing a false distance to the intended target. Laser range finders can be affected by this phenomenon over distances in excess of half a mile. Laser range finders are available as stand-alone portable systems, such as the Vectronix LRF-1000, and on larger military platforms, such as within the ballistic fire control computer equipping the U.S. Army's M1A1 Abrams Main Battle Tank.

Laser Target Designation

Laser range finders can be embedded into larger fire control systems that also encompass a laser designator. A laser designator works in a similar fashion to a laser range finder (see above). However, the primary purpose of a laser designator is to illuminate a target for attack by a laser-guided weapon. A laser designator illuminates a target that is then detected and followed by the laser-guided weapon (see below). Laser designators are included in military systems such as the Thales Damocles combat aircraft targeting pod.

Laser Weapons Guidance

Laser weapons guidance is achieved by the use of laser sensors that can outfit surface-to-surface, air-to-surface, and surface-to-air weapons. Once a target is illuminated by a laser designator (see above), the laser sensor outfitting the weapon detects this laser radiation and transmits guidance commands to the weapons' flight control and propulsion systems, enabling the weapon to adjust its flight profile to ensure an accurate impact. Laser seekers are used by a number of contemporary weapons including the Lockheed Martin AGM-114 Hellfire family of air-to-ground and surface-to-surface missiles.

Optronic Targeting Systems

Optronic targeting systems use television to provide an electronic picture of a target both for fire control and weapons guidance. Television guidance has an advantage in that it provides a detailed view of a target. It cannot, however, depict a target obscured by smoke, dust, rain, or fog.

Optronic Fire Control

Optronic technology is used for target detection in a number of military applications. These include the

Captain Michael Edmonston of the 46th Expeditionary Reconnaissance Squadron operates a Predator MQ-1 aircraft from Balad Air Base, Iraq, on November 5, 2006. The Predators provide surveillance and come equipped with AGM-114 Hellfire missiles to combat the enemy.

Source: U.S. Air Force photo by Airman 1st Class Chad Kellum (released).

Selex Spotter long-range daylight observation camera, which can be used by ground troops to perform reconnaissance. Optronics technology is also used in the Lockheed Martin Arrowhead M-TADS/PNVIS (Modernised Target Acquisition Designation Sight/Pilot Night Vision Sensor) equipping the McDonnell Douglas/Boeing AH-64D Apache helicopter gunship. Due to the inherent limitations of television optronics with regard to obscurants such as smoke and bad weather, television targeting systems are often paired with other technologies, such as laser and infrared systems (see above and below), for use in circumstances where television will not function.

Optronics Weapons Guidance

Alongside its use as a fire control system, television targeting systems can be used for weapons guidance. One weapon using television guidance is

Raytheon's AGM-65 Maverick air-to-ground missile. Prior to launch, the crew of a combat aircraft deploying the AGM-65 activate the missile, which then relays images from its television guidance system into the cockpit. The pilot then moves the crosshairs positioned in the head-up display (a holographic projection of an aircraft's avionics) onto the intended target. The missile's own guidance system automatically follows the placement of the crosshairs, homing in on this location once the weapon is fired. Again, because of the limitations of television guidance, the AGM-65 Maverick can use laser (see above) and infrared (see below) guidance.

Satellite Targeting Systems

Geographical location information, known as geolocation, obtained from satellites can be employed for fire control and weapons guidance. The advantage

of satellite constellations, such as the Navstar Global Positioning System of the United States, is that they provide highly accurate coordinates of a particular target beyond the line of sight and over the horizon unlike laser, optronic, radar, and infrared mechanisms that have their range limited by the curvature of the earth. However, any satellite targeting and weapons guidance system has the risk that its transmissions may be jammed or switched off.

Satellite Fire Control

Geolocation information can be employed to provide satellite-guided weapons with the precise position of their target. Once a target has been designated, by using a laser designator for instance (see above), its geographical coordinates can be derived based on the targets' position relative to the laser designator. A number of weapons systems, such as the Bell AH-1W/Z Super Cobra attack helicopter, now have embedded satellite-based fire control equipment.

Satellite Weapons Guidance

Geolocation can also play an important role in weapons guidance, due to the precision that it can provide. Prior to the employment of a satellite-guided weapon, geolocation coordinates are entered into a weapons' guidance system. At the same time, the weapon will automatically ascertain its own location using its integral satellite guidance system. Once launched, the weapon continually adjusts its flight path based on its own position relative to the targets' location. Satellite guidance can be used to hit both stationary and moving targets. A number of weapons systems use satellite guidance, including Boeing's Joint Direct Attack Munition (JDAM) series of air-to-ground bombs and the Raytheon/BAE Systems M982 Excalibur 6-inch artillery shell.

Radar Targeting Systems

Radar (radio direction and ranging) is used for fire control and weapons guidance. A radar can derive the position of an object and its speed by measuring the time elapsed between the transmission of a microwave pulse toward a target and its reflection back to the radar from the target, a process that occurs at the speed of light. Radar has a distinct advantage over other technologies in that it provides the accurate position of an object in all weather, and

at day or night. However, like satellite-guided targeting systems, radar can be vulnerable to jamming, and its performance can be degraded due to so-called stealth techniques employing radar absorbent materials that reduce the quantity of microwave energy reflected back to the radar.

Radar Fire Control Systems

Radar is employed extensively as a fire control technique as it can rapidly detect moving and stationary targets. Once a target is discovered, the radar operator must determine whether the target is friendly or hostile. This is achieved through the employment of an Identification Friend or Foe (IFF) interrogator. IFF systems send a radio transmission to a transponder fitted to an aircraft, ground vehicle, or ship. The IFF interrogator is programmed to listen for a particular coded radio signal reply transmitted once the transponder has been activated by the IFF interrogator. If no reply is received, or if the coded reply is different from that which the IFF interrogator has been programmed to receive, then the target can be designated as hostile. The radar operator can then mark the target as hostile on his or her radar screen. This information, together with the targets' location, can be transmitted to a specific weapons system, such as a surface-to-air missile. The radar can continue to illuminate the target once the weapon is launched to allow a radar seeker inside the missile to guide the weapon to its target. Some radars can perform general surveillance to detect targets and fire control to provide precise targeting coordinates for weapons. One example is the Raytheon AN/MPQ-65 radar, which equips the MIM-104 PAC-3 Patriot medium-to-high altitude surface-to-air missile system.

Radar Weapons Guidance

Radar can be used to provide weapons guidance. This can be achieved using a radar seeker—a passive system that monitors the electromagnetic spectrum to detect reflections from fire control radar. Alternatively, an active radar guidance system can outfit a weapon allowing it to track a target's position after launch.

Both active and passive radar detections have advantages and disadvantages. A passive radar seeker requires the fire control radar to continuously illuminate a target during the entire engagement

Senior Airman Jessica Morgan Miller is performing an identification friend or foe operational checkout on the B1 Bomber on November 9, 2006, at an undisclosed air base in Southwest Asia. The system allows for aircraft encountered during flight to be identified and placed into categories showing whether the aircraft is military, civilian, or enemy.

Source: U.S. Air Force photo by Master Sergeant Franklin D. Hayes Jr. (released).

sequence from a weapon's launch to target interception. However, the fire control radar can be jammed using an electronic or physical radar countermeasure, or destroyed by an antiradar weapon. Active radar seekers do not require fire control radar to continuously illuminate the target during the engagement sequence, although these weapons can be vulnerable to deception and disruption by physical and electronic radar countermeasures. Several radar-guided weapons exist, including the passive radar-guided Patriot surface-to-air missile and the active radar-guided MBDA Exocet family of anti-ship missiles.

Infrared Targeting Systems

Finally, weapons targeting can be performed by exploiting the infrared portion of the electromagnetic spectrum. Infrared is produced by heat reflected

and generated by objects. Infrared can be detected both during the day and at night, although it can suffer disruption by weather phenomena, such as rain. Infrared-guided weapons are also vulnerable to jamming, which can be achieved by using hot flares that produce a comparatively warmer, and therefore more attractive, target for such a weapon.

Infrared Fire Control Systems

Infrared fire control systems typically include a camera detecting infrared light, which is presented on a television screen. Objects do not typically have a uniform heat signature, making it possible to discern the outline of an object relative to its surroundings. For example, a main battle tank with a running engine will produce a bright image, particularly around its engine compartment, and the vehicle will tend to be warmer than its surrounding

environment, allowing the operator to discern its silhouette. Infrared fire control systems include Lockheed Martin's AN/AAQ-39 product equipping the U.S. Air Force's AC-130U fixed-wing gunships.

Infrared Weapons Guidance Systems

Infrared detection is used extensively by air-to-air and surface-to-air missiles for weapons guidance. This is because an aircraft's engine exhaust presents a highly conspicuous heat signature compared with the surrounding sky. Nevertheless, such weapons can be vulnerable to disruption and deception from hot flares launched by a targeted aircraft in self-defense. Alternatively, a so-called directional infrared countermeasure can be employed to project bright light directly into the missiles' infrared seeker to blind it. Infrared-guided weapons include the Russian 9K38 Igla (North Atlantic Treaty Organization reporting name SA-18 "Grouse") antiaircraft missile and the U.S. AIM-9 Sidewinder air-to-air missile.

TECHNOLOGY

Military technology includes the machines of war and also ideas about how to employ these tools, or what is known as doctrine. Modern militaries make extensive use of technology and actively pursue technological innovation through ongoing research and development programs to improve

existing technology and invent new forms of it. It can be argued that technology is more important to militaries than it is to civilians; in the military, lives depend on it. Today's militaries strive to maintain technological superiority over competitors. The United States spends vast amounts of money on maintaining current forces of aircraft carriers, fleets of aircraft, and cutting-edge land forces, while at the same time dedicating resources to future systems, like space and cyber technology. In the modern era, technology on the battlefield is a necessary component of war.

Theory

Technology, and especially military technology, has improved vastly in the recent era. In the past century, technology changed the way nations fight. The early part of the 20th century introduced aircraft, submarines, and atomic bombs, all important to the methods of war. The latter part of the 20th century ushered in another set of changes to warfare, with developments in computer technology and the start of the Internet. The most difficult aspect of technological change is putting the pieces to work for strategic advantage. It is not enough to have good technology; it must also be incorporated into military thinking. In the 18th century, rifled guns were available, but smoothbore guns persisted. It was not until standardization became commonplace, prices fell, and commanders realized the potential for more accurate fire that the rifled musket came into widespread use. Likewise, some technologies today are cost prohibitive (space weapons), untested (non-lethal crowd control devices), or too radical to fit into military planning. Shaping the battlefield is a key idea in warfare. The strategist must analyze the situation and decide how to best employ the tools of war. Furthermore, strategies must be developed to maximize technological advantage so that it translates into strategic success.

Successful incorporation of technology begins with intelligence, surveillance, and reconnaissance assets. Pulling from a wide variety of sources, including space platforms, aerial observation, signals intelligence, the Internet, and human assets, the commander will analyze the battlespace to determine areas of exploitation. Even before committing forces, a good commander will have thought through the risks and rewards of the upcoming conflict.

Technology is seen as a panacea for diverse problems. In the past 20 years, the U.S. military has sought to maximize technological advantages in order to become more successful and efficient on the battlefield. As well, high-technology systems continue to evolve that promise a way to prevent future wars. In the former are military technologies that make the U.S. military the most powerful in the world, such as the navy's fleet of aircraft carriers and their battle groups, to the Air Force's 5th Generation JSF-35 Fighter now in development. In the latter are a wide variety of technologies that may help avoid war, such as the deterrent capabilities of nuclear weapons to the obviously overwhelming capabilities in American possession.

Military Technology in Practice

The United States currently holds a technological lead over the rest of the world, although some countries may challenge the United States in specific spheres. Its dominance is partly because of American ingenuity and entrepreneurial spirit and, in no small part, due to the vast resources invested in research and development. Its technological advantage includes land, air, and sea weapons systems, and extends into space and the cyber realms as well. Furthermore, American research outstrips the rest of the world. This lead, if continued, may in fact prevent conventional wars on the scale of World War II. The Cold War, marked by high technology, many analysts believed prevented a full-scale war between the United States and the USSR, because both sides had nuclear arsenals that could destroy the other. The deterrent effect of technology prevented war. In the modern age, high-speed Internet, global positioning satellites, and a worldwide communications network are breaking down historical barriers. Information flow is democratizing formerly "closed" countries and introducing them to the market system. As well, personal computers, cell phone technology, and future improvements in video teleconferencing technology will affect human relations and market dynamics around the world.

In the military sphere, the United States has made significant strides in incorporating high technology into strategy. During his most recent tenure as secretary of defense from 2001 to 2006, Donald Rumsfeld promoted the idea of "transformation," or making the military more mobile, flexible, and transportable.

The idea was dependent on high-tech systems replacing legacy systems. New technologies included better arms and armament for individual infantrymen as well as lighter, faster vehicles to transport them. The lighter systems in turn allowed more efficient transport to the far reaches of the globe at times of crisis. Among the new technologies were the Stryker armored combat vehicle, the Squad Automatic Weapon, and the doctrine of the Brigade Combat Team. Rumsfeld's plan was not entirely adopted for financial, strategic, and situational reasons (the United States had just gone to war in Iraq in 2003). The military continues to evolve technological systems for multiple uses. New versions of legacy systems are still in development, with improvements to the M1A2 Abrams Main Battle Tank, the Aegis-equipped guided missile cruisers and *Virginia*-class submarines for the Navy, and the futuristic JSF-35 Joint Strike Fighter aircraft as well as the proposed B-3 bomber aircraft.

In addition to these advances, the United States has made great strides in space, cyberspace, and communications technology. Based on military applications, but with obvious benefits to the civilian market, the United States has invested heavily in communications satellite technology. Real-time command and control, imagery, intelligence, as well as targeting information are all examples of military uses of improved communications technologies. Cell phones, Global Positioning System receivers for directions, and satellite radio are just a few of the technologies that have trickled down from classified government applications to civilian use.

The military improves on existing systems to make them more efficient and also researches technology that has the potential to change the nature of warfare itself. In the recent past, these significant changes include stealth technology, night vision equipment, and network-centric warfare. In the future, significant changes may include different aspects of nanotechnology, unmanned systems, and satellite and Internet technologies. In addition, there are other breakthroughs that cannot be foreseen or predicted; technology development is often radical.

Technology change can be characterized in two ways: evolutionary and revolutionary (sometimes termed disruptive). Evolutionary technology change is indicated by incremental changes in existing technology that improve on older models. One example is the improved fighter aircraft designs with one airframe: the World War II North American P-51

Mustang, which went through significant changes through its A, B, C, and D models. Revolutionary or disruptive technology change includes invention and paradigm shifts. It results in technology that is radically different from existing technology and completely changes technological advantage as well as thinking patterns. Examples include the introduction of submarines in the early 20th century; rockets and missiles during World War II; and the atomic bomb, and in the modern era, the Internet. Finally, there are game-changing technologies that embody both evolutionary and revolutionary change: examples include the launching of the HMS *Dreadnought* in 1906, a warship (evolutionary) that incorporated revolutionary changes in sea power that made all other warships immediately obsolete. Another modern-day example is the unmanned aerial vehicle, known by a number of different acronyms, which is an evolution of existing aviation technology with the revolution of pilotless flight. Unmanned aerial vehicles are still so new that there is a lack of consensus on how to use them properly.

Often technology is developed long before it is widely available to the public at large. Another issue is choice. Competing technologies vie for support and market share, and sometimes one type of technology becomes dominant. The competition between VHS and Betamax is an example; the success of the personal computer over Macintosh is another (although Mac is trying to fight its way back into the market). This poses both benefits and drawbacks. On the one hand, a single technology can lead to standardization, interchangeability, and reduced training requirements. By committing to one technology, everyone becomes familiar with it and costs are lower. However, a single technology is rarely good at every task. Furthermore, one source for technology can lead to a monopoly, or even a crisis in logistics and supply. As an example, currently the United States is banking on the Lockheed Martin JSF-35 to replace all fighter aircraft in the air force, navy, and Marine Corps inventories. The one airframe means that there is only one aircraft for all (fighter) pilots to train on, and serviceability should be better. Standardization of parts will also be a benefit. However, in early testing, the JSF is neither as good as current point interceptors (specifically F-15s and F-16s) nor as good at ground attack as other specific airframes (like the F/A-18 and A-10). It can, however, do a number of roles marginally better. Furthermore,

by choosing one airframe, the military depends on one supplier (in this case Lockheed Martin) for all the planes. If problems emerge in the type, all services will have the same problematic plane.

However, it is argued that one good product is better than too many, as was the case in Germany in World War II where more than 100 different types of aircraft were built. The Germans suffered from too many types of planes to supply and operate during wartime. Ideally, it seems as if a few good types are the best bet for competition, operability, supply, and evolution in most technologies.

In military spheres, it is important to match technology with strategy to produce desired results. Although the U.S. military is the most sophisticated and technology-rich military in the world, a danger exists in too much reliance on military technology. In certain cases, lower technology forces will fight more advanced militaries in what is now referred to as asymmetrical warfare. For the most part, it is always preferable to have the technological advantage. However, technology does not necessarily equate to successes in war. The great military theorist Carl von Clausewitz argued that technology was important, but will (spirit, motivation, etc.) was even more important. Great strategists will be mindful of not only the benefits of technology but also its limitations and drawbacks in a particular battle or war of technology in the fight they are considering.

The U.S. military currently benefits from a number of advanced technologies in the field. From computer and communications networks for coordination in the battle space to night vision goggles for night fighting, to the cornucopia of weapons systems from light machine guns through heavy artillery to air superiority, the American soldier has absolute technological superiority over an enemy. The U.S. military, which is well equipped with these advanced technologies, can rely on these systems but must be mindful that others will try to take advantage of this reliance. Furthermore, a competent enemy will always try to avoid, circumvent, or overcome these advantages. In Iraq, the insurgents fought high-tech coalition forces with decidedly low-tech solutions, including improvised explosive devices. Using garage door openers and antiquated cell phones as detonators and unexploded ordnance as bombs, they threatened soldiers with low-tech weapons.

When the logic of technology is understood and adopted, it can create an advantage in the society, the

economy, or in the military sphere. It is important to have good technology and cutting-edge research, but it is more important to be able to fit technology into a strategy for use on the battlefield. Military personnel on the ground, in the air, or at sea do not benefit from technology that is sitting on a shelf; they need to be able to use it. During World War II, the Germans were the first to develop jet aircraft for combat operations; they achieved a technology breakthrough. But they had difficulty putting the aircraft to use, including serious production problems. The Americans, on the other hand, were able to develop atomic power, and use it to defeat Japan in the Pacific. Although the decision to develop and use the atomic bomb is controversial to this day, this weapon is an example of a technological change in military history.

Conclusion

Militaries will continue to develop new, more efficient, and more effective technologies. And, they will continue to strive for technological solutions to strategic problems. The military that is most successful technologically will continue to promote research and development, design improvement, and close ties with civilian industry and universities. In the near future, successful militaries will tap into, and continue to expand, evolutionary and revolutionary technologies in order to keep pace with existing technology as well as technology that is unforeseen today. However, the best military minds will remember the paradox of technology: while there are benefits, there are also drawbacks, and it is important to not become too reliant on technology. Technology may influence the character of wars, but the nature of humans will likely remain the same.

TELEVISION

From its introduction, television has broadcast the drama of conflict. In its glory years after 1948 and until the early 1960s, cowboys and Indians shot it out in TV Westerns, Americans battled the Germans and Japanese in reruns of World War II combat pictures, and broadcast journalists covered Cold War stories. By the start of the Vietnam War, new technologies and slackened military censorship allowed extensive television coverage of the battlefield, generating heated controversies over the role of the media in wartime. Meanwhile, fictional portraits of war on the small screen became more graphic amid the general liberalization of culture in the 1960s and 1970s and advancing cynicism about the military and government. By the 1980s and 1990s, a slew of small, successful military operations; tighter official restrictions on the news media; and a revived admiration for the World War II generation had led to a rehabilitation of the military's televised image. Finally, the age of 24/7 news coverage of the Global War on Terror since September 11, 2001, has brought new complexity to the depiction of armed conflict on television.

Historical Overview

The technologies that made television possible emerged from the medium it would eventually displace—radio. In the 1930s, the Radio Corporation of America began developing ways to transmit visual images through radio waves. As part of its paean to futuristic machinery, the 1939 World's Fair in New York gave the Radio Corporation of America (RCA) space to publicize the new wonder. Production of television sets soon began but was halted during World War II when the Federal Communications Commission (FCC) enjoined RCA to pour its energies into laboratory research, not television promotion. At the war's end in 1945, Americans still looked to the printed word, radio, and film for entertainment and

news, with roughly equal devotion to all three. Such parity would be shattered by television in the 1950s.

Cold War Television

In 1948, Americans started buying television sets at escalating rates, with 9 out of 10 households owning one by 1960. Programmes on the four early networks (CBS, NBC, ABC, and Du Mont) featured sports, children's shows, situation comedies, dramas, roller derby, and even live feeds from the United Nations. Images of war also traveled the airwaves between 1948 and 1965—as journalism, entertainment, or both.

Although television coverage of the Korean War was limited mainly to stateside opinion programs, nonfiction images of conflict appeared in documentaries. Prominent among these was the Emmy-winning *Victory at Sea*, a 13-hour, 26-part, made-for-television epic aired on NBC in 1952 and 1953. This rousing production, developed in conjunction with the Department of the Navy, told the story of American naval warfare during World War II. NBC showcased a mighty maritime force doing battle with evil enemies. Dramatic footage punctuated the story of defeats and ultimate victory. The theme music lent an air of Hollywood theater to images of real action. Part entertainment, part reportage, and part patriotic spectacle, *Victory at Sea* sounded familiar notes in 1950s-era television combat.

In an age of Cold War–fueled murkiness and fear, televised World War II films and TV Westerns typically pitted archetypes of American virtue against shadowy, sometimes shadowing foes—reassuring contests with predictable outcomes. One popular and long-running television program offered a somewhat more ambiguous picture of the military, a bridge between 1950s-era bombast and Vietnam-era cynicism. The World War II drama *Combat!*, which aired on ABC in 152 episodes between 1962 and 1967, not only told familiar tales of martial camaraderie and strength but also showed lapses in military discipline and the breakdown of unit cohesion. Sergeant Saunders (Vic Morrow) and Lieutenant Hanley (Rick Jason) led men who refused orders, men who accidentally killed civilians and lost their minds over it, men who deserted, men who shot themselves rather than fight. By 1966, with an anti-war movement rising to oppose the Vietnam War, *Combat!*'s producers aired “Hills Are for Heroes,”

a two-part affair that mourned the tragedy of men dying for military objectives of temporary value. Cynicism about the military expanded even further during and after the Vietnam War, with television shows such as *M*A*S*H* (1972–1983) and *Tour of Duty* (1987–1990) addressing the damaging effects of combat and indignities of military life.

The Vietnam Era

The Vietnam War and the 1960s changed the depiction of armed conflict on television, and, in the process, ignited fierce debate over the relationship between the media and the military.

Television news broadcasting expanded just in time to offer more detailed coverage of the guerilla war in South Vietnam. In 1963, CBS and NBC lengthened their nightly newscasts to 30 minutes (ABC followed suit in 1967), just as the Buddhist crisis threatened to undermine President Ngo Dinh Diem's authority and the credibility of his American sponsors. As the United States broadened its commitment to South Vietnam, the conflict in Southeast Asia became increasingly newsworthy. With the longer evening news broadcasts and improved technology, television reporting would define the coverage.

A roster of prominent broadcast journalists made their names covering Vietnam, including Morley Safer, Ed Bradley, Garrick Utley, Ted Koppel, Dan Rather, and Mike Wallace. These reporters brought American television-viewing audiences unprecedented access to combat. They interviewed wounded soldiers and marines, documented the destruction of South Vietnamese villages, recorded interrogations of enemy prisoners, and gradually exposed the confused and tragic nature of the conflict. A prescient documentary, *It's a Mad War*, airing in December 1964 on NBC, exposed friction between U.S. military advisers and their South Vietnamese clients. Segments on Saigon highlighted the corruption and decadence of urban elites and their disengagement from the rural war. During the communist Tet offensive of early 1968, television networks showed chaos on the streets of Saigon. The beloved CBS anchor Walter Cronkite famously visited Vietnam after Tet, declaring the war a stalemate. President Lyndon Johnson understood that Cronkite's defection signaled broader disaffection in middle America.

The graphic and critical nature of some television coverage has led many observers, including the administrations that managed the war, to blame

television for the “loss” of Vietnam. Such critics have impugned the patriotism of journalists and unfavorably compared them with World War II reporters who had “gotten on the team.” It was true that unlike during World War II and most of the Korean War, there was no formal censorship of the press in Vietnam—journalists observed normal constraints about reporting troop movements and such, but otherwise they could go more or less where they pleased and say what they liked. And there was little question that by 1970 or so, much television coverage of Vietnam emphasized dwindling morale, drug use among the troops, racial tensions, and even the murder of officers by their men.

Other commentators have argued differently. They have pointed out that television networks and the media in general wished to see the United States prevail in Vietnam from the beginning and provided patient and supportive coverage. When television reporters showed problematic American operations—as in Morley Safer’s infamous report from Cam Ne in 1965—they did so not to suggest that the United States pull out but often because they wanted their country to do better. And hawkish figures, including the ABC anchor Howard K. Smith, continued to support the war in Vietnam amid the erosion of public approval of the conflict in 1967 and 1968. Along the same lines, scholars Daniel Hallin, William Hammond, and others have demonstrated that television coverage was not nearly as bloody or as negative as critics suggest. The television network executives agreed to a military request to minimize graphic footage of casualties in 1966, partly because they understood that public appetite for such images was limited, partly because they tended to support the war, and partly because they wanted to protect their access to the war zone. Accordingly, various studies have shown that only a small portion of news broadcasts from Vietnam showed violence or casualties.

Finally, scholars of popular opinion hold that support for the Vietnam War, like the Korean War before it, eroded when mounting casualties failed to bring measures of progress or purpose. True, the television news reported those casualties, and certain dramatic televised moments—a South Vietnamese officer shooting a Vietcong prisoner in the head among them—lent a desperate and brutal character to the coverage. But those elements appeared just as often, if not as vividly, in other forms of journalism,

and there’s little evidence that television in particular drove the public from the administration’s side of things. Had the war gone better, these commentators have suggested, television broadcasts would have reported that.

In any event, the Pentagon came away from Vietnam vowing that the press, particularly television reporters, would never again get unfettered access to the battlefield. Even the British, in their 1982 Falklands/Malvinas War, learned the Vietnam lesson and severely limited images of casualties. The next year, when the Reagan administration sent troops to Grenada, reporters were excluded from the island for 2 days. The Pentagon provided the main visual material from the conflict, telling a largely bloodless story. The 1989 invasion of Panama featured similar restrictions on war correspondents, though now the Defense Department allowed carefully selected “pools” of journalists to report on the conflict. The strategies paid off—quick, decisive victories for the United States—and the military enjoyed high public approval ratings

War and Television Since 1989

The Persian Gulf War

The military judged its management of the media in the 1980s a success. Thus, when war with Saddam Hussein broke out in 1991, the brass similarly limited reporters’ access to the battlefield—while carefully putting out their own imagery of combat. The result was a paradox—Americans saw both more and less of war than ever before.

Television journalists bristled at military controls imposed during Operation Desert Storm. If they wanted access to the war zone, pool reporters had to sign agreements limiting their movements and restricting the kinds of stories they could air. Some American reporters were so frustrated that they joined pools from other nations. Others defied the rules and had their credentials stripped by military authorities. CBS correspondent Bob Simon and his crew entered the battlefield without military handlers and were arrested by Iraqi troops. Thus, most of what Americans learned about the war came in televised press conferences by General Norman Schwarzkopf. Because these were beamed back to audiences in the United States, the military effectively bypassed the media and allowed Schwarzkopf to speak directly to the public.

At the same time, the Persian Gulf War also produced unprecedented televised drama, much of it airing on the Cable News Network (CNN), the only 24-hour news service available around the world at that time. Saddam let its correspondents report live from Baghdad—behind enemy lines—as coalition bombs started falling on January 17, 1991. Audiences around the globe thus witnessed the start of the war even before the Pentagon had officially announced it. Meanwhile, in CNN coverage as well as in Schwarzkopf's briefings, the public saw airstrikes against the Iraqis in extraordinary footage shot from far above the battlefield, the nose cones of missiles, and the cockpits of aircraft. This carefully censored footage, along with computer graphics aired by the news networks, lent the Persian Gulf War a video-game quality—the military tended only to release footage of missiles that hit their targets.

The military also restricted access to the ugly sides of war. Few images of casualties made it to television screens. Yet even when reporters shot footage of the infamous “Highway to Hell” airstrikes at the end of the conflict, they tended not to air it. Various polls have shown that the American public rejects graphic imagery of war; during the 1993 UN operation in Somalia, some viewers recoiled when networks aired footage of jubilant Somalis dragging the corpse of an American soldier through the streets of Mogadishu. To some media critics, the result in the 1990s was to paint a rosy picture of war, making it romantic again after Vietnam. Military officials responded to such complaints with their standard post-Vietnam argument—unfettered access led to distorted coverage and the potential erosion of public support back home.

The successful military missions of the 1980s and 1990s, along with their relatively bloodless appearances, helped revive public faith in the armed forces. Both reflecting and helping shape that development was a renewal of World War II nostalgia. As World War II veterans died off in increasing numbers and Americans observed 50th anniversaries (Pearl Harbor, D-Day, the war's end), mass media broadcast the World War II memory boom. Hollywood films and popular books led the way in the 1990s, but by the new century, the trend hit television. HBO aired the 10-part miniseries *Band of Brothers* in 2001 and *The Pacific* in 2010; Ken Burns's documentary *The War* ran on PBS in 2007. These productions included more gritty realism about combat than some earlier

World War II films and television documentaries but still cloaked that material in “Good War” ideology. Indeed, at the televised dedication of the World War II memorial in May 2004, President George W. Bush explicitly equated the moral stakes of that conflict with those of the new war on terror—a war that was playing out on the small screen.

Television and the Global War on Terror

Although Muslim fundamentalists had carried out terrorist attacks before September 11, 2001, it was on that day that millions of television viewers quite literally watched the Global War on Terror begin. Many Americans heard about the first plane hitting the World Trade Center by word of mouth or through the Internet, radio, or television, and then saw the second one happen live. Footage of the attacks, rescue efforts, and cleanup played endlessly on the small screen for months afterward.

The ensuing wars in Afghanistan and Iraq saw changes in the way television reporters and other journalists covered conflict. Responding to critiques from the press about the tight restrictions of the Persian Gulf War and the War in Afghanistan in 2001, the Pentagon “embedded” journalists with military units during the Iraq War in 2003. This provided greater access to combat—and thus the unprecedented spectacle of live images from the battlefield—but tethered reporters to particular units and the whims of their military handlers. With more cable news networks than in 1991, as well as videos posted on Internet news sites, the sheer volume of footage from Iraq (and much less so, Afghanistan) was staggering. But television news coverage generated a host of debates and controversies.

New communications systems allowed live feeds from the war zones. This made for dramatic television, but some media critics also felt that it gave viewers snapshots of action (or desert sand whizzing by) rather than in-depth coverage of the war's purposes or consequences. It was left up to the networks to glue all this footage together into a coherent narrative, which they did with varying degrees of success. Like in 1991, some critics felt that the constant footage sanitized the war and numbed viewers to combat's results. Network rules and the dangers of combat continued to prevent the most graphic images from reaching stateside audiences. Meanwhile, though American networks focused on

military technologies and the progress of the war, Arabic networks, such as Al Jazeera, emphasized the human toll of the conflict.

Another controversy involved the notion of journalistic objectivity. Some commentators suggested that embedding reporters with particular military units compromised their ability to report the war dispassionately, with the correspondents dependent on military protectors not only for their lives but also for their press credentials. Also, the wave of patriotism that followed 9/11 carried forward, for a time, into the Iraq War of 2003–2011. MSNBC and Fox News used American flags and the administration term *Operation Iraqi Freedom* to frame their coverage. Some observers had no objection to American reporters and networks taking the American side in the war, while others argued that the role of the media is not to serve as a mouthpiece for the government and military. But if television is about ratings, these strategies worked—the patriotism of the Fox News Channel and MSNBC led to huge increases in viewership for those news organizations. Audiences seeking a grittier view may have turned to the short-lived Iraq drama *Over There* in 2005 or the popular counterterrorism thriller *24* between 2001 and 2010.

Looking ahead, the controversies television networks have faced in their depictions of war may recede as more and more viewers turn to Internet news sites, blogs, and websites like YouTube. During the Vietnam War, the small screen offered the only footage of the conflict. With so many other sources now available, it is proving beyond the powers of any particular government, news organization, or military branch to manage the material reaching homefront audiences. In any case, the basic question remains: Does this greater access to combat imagery make for a more informed and sensitive citizenry, or one numbed to the violence of war?

TERRORISM

The subject of terrorism is of central relevance for policymakers in the United States and allied governments. Domestically, homeland security has become an endemic feature of American culture at every level of government and in the private sector. In particular, the armed forces of the United States have significantly adapted operational doctrine and training to respond to the global threat posed by terrorists.

Terrorism has been a disturbing attribute of human conflict since the first accounts of warfare and conquest were recorded. History is replete with episodes of terrorism, commonly rationalized as a necessary means to achieve superior ends. Nations and empires have eliminated enemies on a grand scale, insurgent movements and zealous individuals have violently sown widespread disorder, and political and religious ideologies have glorified extremist behavior—incidents that perpetrators hold to be completely justifiable.

The evolution of terrorism in the modern era is primarily, though not exclusively, a conflict between adversaries waging, on one side, a self-described war on terrorism and, on the other, a self-described holy war in defense of their religion. It emerged in the modern era but has taken new forms in the decade following the attacks of September 11. This entry first considers the definition of terrorism, its causes,

and its goals and then examines the characteristics of terrorism in the post-9/11 world. The use of weapons of mass destruction and the indiscriminate use of violence typify this modern terrorism, which has been manifested in asymmetric warfare carried out by urban guerrilla movements and suicide bombings.

Defining Terrorism

Some acts of political violence are clearly acts of terrorism. Most people would agree that politically motivated bombings of marketplaces, massacres of enemy civilians, and routine government use of torture are terrorist acts. Behind each incident of terrorist violence is some deeply held belief system that has motivated the perpetrators. Such systems are, at their core, extremist systems characterized by intolerance. Extremism is a precursor to terrorism—it is an overarching belief system terrorists use to justify their violent behavior. Those who violently act out their extremist beliefs are terrorists. However, it is important to appreciate that there are many definitional gray areas. Depending on which side of the ideological, racial, religious, or national fence one sits, political violence can be interpreted either as acts of unmitigated terrorist barbarity or as freedom fighting and national liberation.

Among experts, there is some consensus—but no unanimity—on what kind of violence constitutes an act of terrorism. Governments, individual agencies within governments, and private agencies have each developed, adopted, and designed their own definitions, and academic experts have proposed and analyzed dozens of definitional constructs. One complication is that most definitions focus on political violence perpetrated by dissident groups, even though many governments have practiced terrorism as both domestic and foreign policy. The result is a remarkable variety of approaches and definitions. This lack of unanimity, which exists throughout the public and private sectors, is an accepted reality in the study of political violence.

The United States has not adopted a single definition of terrorism as a matter of government policy, instead relying on definitions developed from time to time by government agencies. These definitions reflect the U.S. traditional law enforcement approach to distinguishing terrorism from more common criminal behavior. The following definitions are a sample of the official approach.

The U.S. Department of Defense defines terrorism as the unlawful use of, or threatened use of, force or violence against individuals or property to coerce and intimidate governments or societies, often to achieve political, religious, or ideological objectives. The U.S. Code defines terrorism as illegal violence that attempts to intimidate or coerce a civilian population, influence the policy of a government by intimidation or coercion, or affect the conduct of a government by assassination or kidnapping. The Federal Bureau of Investigation has defined terrorism as the unlawful use of force or violence against persons or property to intimidate or coerce a government, the civilian population, or any segment thereof, in furtherance of political or social objectives. For the State Department, terrorism is premeditated, politically motivated violence perpetrated against noncombatant targets by subnational groups or clandestine agents, usually intended to influence an audience.

Using these definitions, the following common elements can be used to construct a composite definitional model: Terrorism is a premeditated and unlawful act, in which groups or agents of some principal engage in a threatened or actual use of force or violence against human or property targets. These groups or agents engage in this behavior intending the purposeful intimidation of governments or people to affect policy or behavior with an underlying political objective.

Causes of Terrorism

Experts have long struggled to identify the central causes of terrorist violence. The most fundamental conclusion in this regard is that terrorism originates from *many* sources. The final decision by an individual or group to accept a fringe belief or to engage in terrorist behavior is often a complex process. The decision to engage in violence may be subsumed within the following classifications.

Sociological Explanations

Sociological explanations generally hold that terrorism is a product of intergroup conflict that results in collective violence. The sociological approach argues that terrorism is a group-based phenomenon that is selected as the only available strategy by a weaker group. In essence, the disadvantaged group asserts its rights by selecting a methodology—in this

case, terrorism—that from the group’s perspective is its only viable option. The selection process is based on the insurgent group’s perceptions and its analysis of those perceptions.

Psychological Explanations

Psychological approaches to explaining terrorism broadly examine the effects of internal psychological dynamics on individual and group behavior. Although individuals and groups act out of certain idiosyncratic psychological processes, their behavior is neither insane nor necessarily irrational. Those who engage in collective violence are, in many respects, “normal” people. Some experts argue that the decision to engage in political violence is an outcome of significant events in individual lives that give rise to antisocial feelings. They actively seek improvement in their environment or desire redress and revenge from the perceived cause of their condition. Research has *not* found a pattern of psychopathology among terrorists. Thus, psychological explanations are fairly broad approaches to the dynamics of terrorist behavior. These explanations may be summarized as follows:

- Terrorism is a technique for maintaining group cohesion and focus. Group solidarity overcomes individualism.
- Terrorism is a necessary process to build the esteem of an oppressed people. Through terrorism, power is established over others, and the weak become strong. Attention itself becomes self-gratifying.
- Terrorists consider themselves an elite vanguard. They are not content to debate the issues, because they have found a truth that needs no explanation. Action is superior to debate.

Terrorism as Rational Choice

An important explanatory theory for terrorism is that terrorist violence is a choice, a rational decision from the revolutionary’s perspective, to adopt specific tactics and methodologies to defeat an adversary. These methodologies are instruments of rational strategic choice, in which terrorism is adopted as an optimal strategy. All that is required for final victory is the political and strategic will to achieve the final goal. Selecting terrorism is a process based on the experiences of each insurgent group

and is thus the outcome of an evolutionary political progression. As a result, terrorism is simply a tool, an option, selected by members of the political fringe to achieve a goal. Terrorism is a deliberate strategy, and success is ensured as long as the group’s political and strategic will remains strong.

Objectives and Effectiveness of Terrorist Violence

Politically violent groups and movements show certain similarities in their objectives. Several commonalities may be summarized as follows:

Changing the Existing Order

At some level, all terrorists seek to change an existing order, even if it is simply a short-term objective to disrupt the normal routines of society by inflicting maximum casualties. When evaluating what it means to change an existing order, one must take into consideration the different profiles of terrorist movements, their motives, and the idiosyncrasies of individual terrorists.

Psychological Disruption

An obvious objective is to inflict maximum psychological damage by applying dramatic violence against symbolic targets. When terrorist violence is applied discerningly, the weak can influence the powerful, and the powerful can intimidate the weak. Cultural symbols, political institutions, and public leaders are examples of iconic (nearly sacred) targets that can affect large populations when attacked.

Social Disruption

Social disruption is an objective of propaganda by deed. The ability of terrorists and extremists to disrupt the normal routines of society demonstrates both the weakness of the government and the strength of the movement; it provides terrorists with potentially very effective propaganda. When governments fail to protect the normal routines of society, discontent may spread throughout society, thus making the population susceptible to manipulation by a self-styled vanguard movement. For example, bombing attacks on public transportation systems certainly cause social disruption. A group might be attacked specifically to deter those individuals from traveling through a region or territory.

Creating a Revolutionary Environment

Dissident extremists understand that they cannot hope to win in their struggle against the state without raising the revolutionary consciousness of the people. For many terrorists, propaganda by deed is considered the most direct way to create a broad-based revolutionary environment. Revolutionary theorists predict that terrorism would force the state to overreact, the people would understand the true repressive nature of the state, and a mass rebellion would occur—led by the revolutionary vanguard.

The Effectiveness of Terrorist Violence

Terrorism is arguably effective—however defined—in some manner to someone. The key for terrorists is to establish a link between methods used and desirable outcomes. Of course, success and effectiveness are subjective considerations. In this regard, terrorists tend to use unconventional factors as measures. For example, terrorists have been known to declare victory using the following criteria:

- *Acquiring global media and political attention:* At times, focusing world attention on the terrorists' cause is itself a measure of success.
- *Having an impact on a target audience or championed constituency:* Terrorists use propaganda by deed to affect audiences, hoping to rouse them to action or incite a society-level response. Victim audiences, neutral audiences, and championed groups can all be affected by a terrorist event. When an incident occurs, extremists and their supporters assess reactions from these audiences.
- *Forcing concessions from an enemy interest:* Enemy interests—broadly defined—will sometimes concede to the demands of a politically violent movement. Concessions vary in magnitude. They can be made as short-term and immediate concessions or as long-term and fundamental, whereby an entire society essentially concedes to a movement.
- *Disrupting the normal routines of a society:* An obvious measure of effectiveness is whether the normal routines of society can be affected or halted by a terrorist incident or campaign. Some targets—such as the commercial transportation industry—can be selectively attacked to the point where their operations will be disrupted.

- *Provoking the state to overreact:* One outcome that terrorists allude to as a measure of effectiveness is the state's imposition of violent security countermeasures in response to a terrorist environment.

Historical Prelude to the Modern Terrorist Environment

The histories of every nation give rise to specific anti-state environments that are unique to their societies. Recent history from North America and Europe illustrate this point.

In the United States, leftist terrorism predominated during the late 1960s through the late 1970s, at the height of the anti-Vietnam War and people's rights movements. Acts of political violence—such as bank robberies, bombings, and property destruction—took place when some Black, White, and Puerto Rican radicals engaged in armed protest. This changed in the 1980s, when the leftist remnants either gave up the fight or were arrested. Around this time, right-wing terrorism began to predominate when some racial supremacists, religious extremists, and antigovernment members of the Patriot movement adopted strategies of violence.

In the United Kingdom, the terrorist environment was shaped by the sectarian conflict in Northern Ireland, which was characterized by both antistate and communal violence from 1969 until the peace settlement in 1999. The nationalist Provisional Irish Republican Army (IRA) was responsible for most acts of antistate political violence directed against British administration in Northern Ireland. During the same period, Protestant Loyalist terrorism tended to meet the criteria for communal terrorism rather than antistate terrorism, because Loyalist paramilitaries targeted pro-IRA Catholics rather than symbols of governmental authority. The IRA responded in kind, so that more than 3,500 people had been killed on both sides by the 1999 cease-fire.

In West Germany, from the late 1960s through the mid-1980s, the leftist Red Army Faction engaged in a large number of bank robberies, bombings, assassinations, and other acts of antistate violence aimed at destabilizing the West German government. The Red Army Faction also targeted the North Atlantic Treaty Organization presence in West Germany, primarily focusing on U.S. military personnel. After the

fall of the communist Eastern bloc in 1989 and the reunification of Germany, Red Army Faction-style leftist terrorism waned. Around this time, rightist neo-Nazi violence increased—much of it was directed against non-German *Gastarbeiters*, or guest workers. The perpetrators of this violence were often young skinheads and other neofascist youths. Many of these rightist attacks occurred in the former East Germany.

In Italy, the leftist Red Brigade was responsible for thousands of terrorist incidents from the early 1970s through the mid-1980s. Originating in the student-based activism of the late 1960s and early 1970s, Red Brigade members were young urban terrorists whose campaign is best described as a nihilist attempt to undermine capitalism and democracy in Italy. By the late 1980s, Italian police had eliminated Red Brigade cells and imprisoned their hard-core members. During this period, Italian neofascists also engaged in terrorist violence, eventually outlasting the leftist campaign, and remained active into the 1990s.

In Spain, antistate terrorism has generally been nationalistic or leftist. Without question, the most prominent was the nationalist and vaguely Marxist ETA (*Euskadi Ta Askatasuna*). ETA was founded in 1959 to promote Basque independence. ETA was rife with factional divisions—at least six factions and subfactions were formed—but their terrorist campaign continued, despite the considerable political rights the Spanish government granted them and the loss of popular support among the Basque people. A right-wing terrorist group, Spanish National Action (*Accion Nacional Española*) was formed as a reaction to ETA terrorism.

Post-9/11: The New Terrorism and the Modern Terrorist Environment

The post-9/11 era is different from previous eras because the new terrorism espouses vaguely articulated political objectives, indiscriminate attacks, attempts to achieve maximum psychological and social disruption, and the potential use of weapons of mass destruction. It also includes an emphasis on building horizontally organized, semiautonomous cell-based networks. The modern era is characterized by the threat of weapons of mass destruction, indiscriminate targeting, and intentionally high casualty rates.

The New Terrorism should be contrasted with traditional terrorism, which was typically characterized by the following:

- Clearly identifiable organizations or movements
- Use of conventional weapons, usually small arms and explosives
- Explicit grievances championing specific classes or ethno-national groups
- Relatively surgical selection of targets

New information technologies and the Internet create unprecedented opportunities for terrorist groups, and violent extremists have become adept at bringing their wars into the homes of literally hundreds of millions of people. Those who specialize in suicide bombings, car bombs, or mass-casualty attacks correctly calculate that carefully selected targets will attract the attention of a global audience. Cycles of violence thus not only disrupt normal routines but also produce long periods of global awareness. Such cycles can be devastating. The growing threat from the New Terrorism adds a unique dimension to the terrorist environment of the 21st century.

Weapons of Mass Destruction and Objectives of the New Terrorism

The redefined morality of the New Terrorism opens the door for methods to include high-yield weapons and for targets to include large populations. Symbolic targets and enemy populations can now be hit much harder than in the past; all that is required is the will to do so. Terrorists may strike with the central objective of killing as many people as possible. They are not necessarily interested in overthrowing governments or changing policies as their primary objectives. Rather, their intent is simply to deliver a high body count and thereby terrorize and disrupt large audiences. For example, the 1993 and 2001 attacks on the World Trade Center in New York City by radical Islamists, 1995 sarin nerve gas attack in Tokyo by Aum Shinrikyo, and the 1995 bombing in Oklahoma City by American terrorists were all intended to kill as many civilians as possible and to demonstrate the vulnerability of society. Little if any consideration was given to changing government policies.

The Threat From Homegrown Jihadists

There is a significant threat of terrorist attacks from domestic terrorists who adopt violent jihadi

beliefs even though they live or are raised in Western countries. The attacks in March 2004 in Spain, July 2005 in Great Britain, and November 2009 at Fort Hood in the United States are examples of this new threat.

The Madrid Train Attacks

Spain suffered its worst terrorist attack on March 11, 2004, when terrorists detonated 10 bombs on several commuter trains in Madrid after delivering them in backpacks dropped at key locations. The explosions were synchronized, occurring within a span of 20 minutes at the height of rush hour, when the trains were certain to be crowded with commuters. Casualties were high: 191 people were killed and more than 1,500 were injured. Casualties could have been more severe, but fortunately, three additional bombs (also in backpacks) failed to explode and were later detonated safely by Spanish authorities.

The London Transportation System Attacks

On July 7, 2005, four bombs exploded in London, three on London Underground trains, and one on a double-decker bus, killing more than 50 people and injuring more than 700. The attack was well synchronized by suicide bombers, so that the three Underground bombs exploded within 50 seconds of each other. Several days later, on July 21, an identical attack was attempted but failed when the explosives misfired. Four bombs—like those in the first attack, three on Underground trains and one on a bus—failed to detonate because the explosives had degraded over time. Investigators quickly identified four suspects from video surveillance cameras. All were residents of London. A fifth bomb was found in a London park on July 23, abandoned by a fifth bomber. Authorities were acutely concerned because British-based cells—sympathizers of al Qaeda—were responsible for both the attacks.

The Fort Hood Incident

On November 5, 2009, a gunman opened fire in the sprawling military base at Fort Hood, Texas, killing 13 people and wounding 29. The attack occurred inside a Fort Hood medical center, and the victims were four officers, eight enlisted soldiers, and one civilian. The shooter was Army Major Nidal Malik Hasan, a psychiatrist at the base who treated returning veterans for combat stress. After the Fort

Hood attack, investigators uncovered connections between Hasan and an openly radical cleric named Anwar al-Awlaki. Like Hasan, Awlaki grew up in the United States, having been born in New Mexico. He eventually became a dedicated jihadi who specialized in recruiting English-speaking Muslims and Muslims who were raised in the West, the rationale being that such recruits would be able to blend in more easily. Awlaki also became known as a propagandist who maintained a website with his writings about how to wage jihad. He was believed to operate from Yemen.

Asymmetrical Warfare and the New Terrorism

The concept of asymmetrical warfare refers to the use of unconventional, unexpected, and nearly unpredictable methods of political violence. Terrorists intentionally strike at unanticipated targets and apply unique and idiosyncratic tactics. This way, they can seize the initiative, redefine the international security environment, and overcome the traditional protections and deterrent policies that societies and the international community use.

The Appeal of Asymmetrical Conflict

Dissident terrorists are quantitatively and qualitatively weaker than conventional security forces. In today's intensive security environment, they simply cannot prevail or last indefinitely in an urban-based guerrilla campaign. Because of this, state-level rivals must resort to unconventional and subversive methods to confront U.S. and Western interests. At the same time, they must also deliver maximum propaganda and symbolic blows against the seemingly overwhelming power of enemy states or societies.

Netwar: A New Organizational Theory

The New Terrorism incorporates maximum flexibility into its organizational and communications design. Semiautonomous cells are either prepositioned around the globe as sleepers (e.g., the 2004 Madrid terrorists) or they travel to locations where an attack is to occur (e.g., the September 11 hijackers in the United States). They communicate using new cyber and digital technologies. An important concept in the new terrorist environment is the notion of netwar, in which organizational strategies are linked to technologies in the information age. In this way, independent small groups maintain

communication and organizational solidarity. These new “internetted” movements have made a strategic decision to establish virtual linkages via the Internet and other technologies.

Case: The Suicide Bombers

“Human bombs” have become an accepted method of political violence in a number of conflicts. Although some examples of suicidal behavior by ideological extremists can be cited, most incidents have been committed by ethno-national and religious terrorists. When considering the tactical and symbolic value of suicide attacks, it is instructive to recall the words of the Chinese military philosopher Wu Ch’i: “One man willing to throw away his life is enough to terrorize a thousand.”

In some conflicts, suicide bombings have occurred only rarely. For example, the IRA, ETA, and European leftists and rightists did not use suicidal violence. In others, suicide attacks have been common. The Tamil Tigers in Sri Lanka, Hezbollah (Islamic Jihad) in Lebanon, several Palestinian groups in Israel, and al Qaeda are all examples. In other conflicts, suicide operations became a signature method, as with Chechen rebels and Iraqi insurgents.

The New Terrorism is thus characterized by a new doctrine that allows for the use of weapons of mass destruction, indiscriminate attacks, maximum casualties, technology-based terrorism, and other exotic and extreme methods. It is trying to break the enemy’s will to resist by whatever means are at its disposal.

TEXTRON, INC.

Textron Inc. is a multi-industry conglomerate with a worldwide network of aircraft, defense, industrial, and finance businesses.

Textron was started by Royal Little in 1923 as the Special Yarns Corporation of Boston, Massachusetts. It became the Atlantic Rayon Company and prospered during World War II, in part due to its parachute-manufacturing contracts with the U.S. Army. It renamed itself Textron in 1943 to emphasize its production of synthetic fabrics. After the war, it diversified into fabric-related household products and clothing and began acquiring nontextile companies beginning in 1953.

In 1960, Textron purchased Bell Aircraft, the makers of Bell Helicopters, for \$32 million. The three divisions of Bell Aircraft—Bell Helicopter, Bell Aerosystems, and Hydraulic Research—were combined into Bell Aerospace. Today, Textron’s Bell Division manufactures advanced military helicopters and tilt-rotor aircraft for the U.S. government and commercial helicopters for corporate, utility, police, and medical helicopter operators.

The Bell 47, a single-engine, twin-blade light helicopter, entered military service in 1946 and was used extensively in the Korean War as the H-13 Sioux. The television series *M*A*S*H* showcased the H-13. The Bell 47 was also used by the National Aeronautics and Space Administration during simulation tests of the lunar lander.

The UH-1 Iroquois, nicknamed the Huey, entered production in 1960 as the first turboshaft helicopter used by the U.S. military. More than 7,000 were used in the Vietnam War. The Huey was originally

designed as a medical evacuation helicopter and was prototyped in 1956. It has been continually upgraded, and in its current configuration, the UH-1Y entered into Marine Corps service in 2008 as a twin-engine, four-blade chopper.

James Hardyman became Textron's president in 1989 and initiated several important acquisitions, including Cessna Aircraft, a maker of small- to medium-sized business jets, in 1992. Cessna's key designs include Models 172, 182, and 206.

The year 1989 also saw the start of production of the tilt-rotor vertical takeoff and landing vehicle, the Osprey V-22, in a joint venture between Textron's Bell Division and Boeing. The V-22 grew out of a Department of Defense project for an aircraft that melded the capabilities of a helicopter and a turboprop cruiser. The Bell-Boeing version was commissioned in 1983. Today, it is being fielded by the U.S. Air Force and the Marine Corps and has been deployed for combat operations in Iraq and Afghanistan. The V-22 has a crew of four and can transport up to 32 troops. Its cruising speed is 277 miles per hour and it has a range of just more than 1,000 miles. It can be configured with two high-powered machine guns.

The V-22 has been the subject of controversies over its cost and safety record. The original 1986 development budget was \$2.5 billion, but as of 2008, more than \$27 billion has been spent, and a similar amount will be needed to complete production. In 2001, three Marine Corps officers were implicated for falsifying maintenance records to increase the appearance of V-22 reliability. Five V-22 crashes have been reported as of April 9, 2010, when three U.S. servicemen died after their aircraft went down in Zabul Province, Afghanistan.

In 2009, the Textron Defense Systems (TDS) subsidiary, which is responsible for the development of military and aerospace products, reported \$2 billion in earnings. The TDS unit manufactures air-launched weapons, smart submunitions (cluster bomblets), intelligent battlefield munitions and sensor systems, and ground and airborne surveillance systems.

Among TDS's most important systems are two air-launched delivery systems. The first, the CBU-97 Sensor Fuzed Weapon, is a U.S. Air Force 1,000-pound-class freefall Cluster Bomb Unit. The CBU-97 carries 10 submunition dispensers (the BLU-108), each carrying four small projectiles called "Skeets." The weapon can detect and penetrate

various vehicles, including tanks, using infrared and laser sensors. The CBU-97 was first deployed in combat on April 2, 2003, in Operation Iraqi Freedom. The second delivery system, the Universal Aerial Delivery Dispenser (U-ADD), is a 35-pound generalized airborne delivery system for lethal and nonlethal payloads.

In addition to the BLU-108 submunition dispenser, TDS offers two other munition and submunition products. The Clean Area Weapon (CLAW) is a 64-pound cluster bomb used against personnel and materiel. The STS Submunition is derived from the BLU-108 and can be deployed from cruise missiles and drones. TDS offers several other munition products that combine explosives, sensors, and communication electronics into compact delivery packages. All feature safeguards to protect against nondetonation and are up to 99% effective in this regard.

TDS also produces the Medium Wave Infrared Array (MIRA) hardware/software solution to support intelligence-gathering activities aboard USAF RC-135 Cobra Ball reconnaissance aircraft. The Mobile Microwave Landing System (MMLS) has been successfully used to land aircraft in hostile terrain, such as Bosnia, Kosovo, Albania, and Afghanistan.

The most cutting-edge weapons program undertaken by TDS relates to Directed Energy Weapon (DEW) systems, commonly called laser weapons. Its ThinZag ceramic-based laser technology has been contracted to two different government agencies for development and testing: the Department of Defense Joint High Powered Solid State Laser Program, and the Defense Advanced Research Projects Agency High Energy Liquid Laser Area Defense System. ThinZag is an improvement over earlier crystalline-based lasers in terms of durability and cost-efficiency. While promising, DEW technology still has to overcome challenges related to weather conditions, power consumption, and focus dispersion. TDS's government contracts indicate that it will work on research to overcome these challenges.

TDS offers key technology to the U.S. Homeland Security Department through its Adaptable Radiation Area Monitor (ARAM). The device uses spectroscopy to detect radiation in land-based and marine applications. It is designed to monitor flows of traffic without detection or impact. ARAM can be deployed at fixed locations or be carried by

vehicles and persons for portable detection requirements. The U.S. Secret Service employs at least one truck-deployed ARAM unit, and the device is used by various law-enforcement organizations, such as the New Jersey State Police.

AAI Corp, a Textron unit since 2007, develops the RQ-7B Shadow unmanned aircraft system (UAS) for use by the U.S. Army and Marine Corps, which has seen service in Iraq. It is used for surveillance and delivery operations in sensitive areas.

Textron seems well positioned, with its intelligence-gathering and threat-detection systems, to continue its close cooperation with the U.S. military and security establishment as the United States continues to engage in counterterrorism operations

THUCYDIDES

Thucydides was an Athenian historian of the Peloponnesian War (431–404 BCE). The conflict between Athens, Sparta, and their allies convulsed the entire Hellenic world and inspired him to compose the first analytic contemporary military history in Western literature. His work is not only a primary source for the military and political events of the 5th century BCE but also a fundamental text for the study of political science and international relations.

What little is known of Thucydides personally is derived almost entirely from his own work in which he figures as an actor. Born about 460 BCE, he was an unabashed admirer of Pericles and his political and imperial policies. In 424 BCE, Thucydides entered into office as one of Athens's 10 annually elected generals. While serving in the north Aegean, he had the misfortune to find himself pitted against Brasidas, one of the most capable Spartan commanders of the war. Failure on campaign led to his exile by the Athenian assembly, and he presumably spent the remainder of his life working on his history, which breaks off with the events of 411 BCE.

An experienced soldier, his history may be read with profit by those interested in operational detail. Above all, however, it is his higher level strategic and political analyses that have remained timeless. As it has come down to us, his history consists of eight books. It details the background and outbreak of the war, the inconclusive first 10 years of fighting in the so-called Archidamian War, the unstable peace brokered by Nicias, Athens's catastrophic expedition to Sicily, and the opening years of the renewed hostilities that eventually resulted in Athens's final defeat. Methodologically, Thucydides explicitly favored rigorous autopsy with a didactic purpose. He notes that his work is "a possession for all time" and that, human nature being what it is, future statesmen among his readers would likely find themselves in situations similar to those it describes. His treatment is therefore mainly restricted to serious analysis of politics and war with little room for ethnographic or mythological digressions.

His multilayered analysis of the outbreak of the war includes the note that the "truest" cause was the growth of Athenian power and the fear it inspired in the Spartans. This structural and psychological explanation accords well with the modern Realist theory of power transition crises leading to hegemonic war. However, Thucydides's narrative is not simply deterministic. Fear, honor, and self-interest on the part of even second-tier powers such as Corinth, Corcyra, and Thebes led to decisions and policies that mattered and affected the course of events.

In his analysis of strategy, Thucydides emphasizes the need for preparation and husbanding of resources for war. He commends rational and careful planning and condemns analysis based on hope or wishful thinking. He approves of Pericles's Fabian policy of avoiding pitched battle with the superior

Peloponnesian army and minimizing risk in favor of asymmetric reliance on the fleet, massive financial resources, and city walls. While the Spartans could and did repeatedly devastate Attica, they were unable to starve Athens into submission until they achieved naval superiority with Persian backing.

On the other hand, Thucydides also notes the limits of strategy and rational planning, no matter how carefully conceived. The hazards of war can be unpredictable. Chance, politics, and the enemy all play a part. No one could have predicted the plague that swept through Athens in the early years of the war. After the death of Pericles, the Athenians disregarded defensive strategies and looked toward generals and policies that promised greater rewards, but at higher risk. Likewise, he notes that the citizens of Chios had properly and rationally judged their moment to revolt against Athens, but found success far more difficult than they first imagined. In Thucydides's estimation, even so great a failure as the Sicilian expedition was not so much due to the Athenians' strategic error as to political divisions and the nature and determination of their opponents.

Thucydides's hard-nosed understanding of international relations is highlighted by the treatment of smaller powers at the hands of Athens and Sparta. It is not justice but expediency that moves the Athenians to spare the population of Mytilene in 428 BCE and the Spartans to execute the defenders of Plataea in 427 BCE. This point is driven home by the famous "Melian Dialogue," in which the Athenians explicitly note that human nature and their own desire for safety drive men to rule where they can. This conception of states being necessarily guided by their interests rather than morality has deeply influenced modern Realist thinking regarding international relations.

Whether or not Thucydides personally approved of this amoral approach to international relations, he reveals an extremely negative view of such power-maximizing calculations when they are applied to internal disputes. His discussion of civil strife at Corcyra, and the nature of subsequent revolutions, is the first such analysis in Western scholarship. Thucydides notes that the violent effects of revolutions can quickly escalate, resulting in the complete breakdown of civil society. This is particularly true under the tensions of war and when foreign interference is likely. Indeed, so dangerous is revolution that Thucydides notes that it was not disaster in Sicily

but internal dissension that brought on the final defeat of Athens.

Above all, for Thucydides, war is a dangerous business that must be approached prudently. Even when approached with caution, it is a harsh teacher capable of emphasizing the worst aspects of human nature and defeating rational calculation.

TIME, MILITARY

Most U.S. civilians equate military time with the 24-hour clock, a convention for counting the hours of the day from 0 to 24, and with the expression "Zulu time," a code for the time of day at the meridian through Greenwich, England. But for the U.S. military's global operations, precise time is crucial to navigation, geographical positioning for locating forces and targets, and secure communications. Military time, therefore, is more than a method for counting the hours. It is also an authoritative source of time and a set of methods to disseminate synchronized time worldwide.

The key system for relating time to location information has become the Global Positioning System (GPS). GPS employs a constellation of earth-orbiting satellites, depends on precise atomic frequency standards (also known as "atomic clocks"), and distributes Coordinated Universal Time (UTC), an international time scale closely coordinated with international civilian scientific bodies and shared

with civilian users. Through a joint armed services program, the U.S. Air Force manages procurement and operations for GPS.

The 24-Hour Clock

In this method of counting the hours, the day runs from 00:00:00 to 23:59:59 UTC. UTC is derived from International Atomic Time with leap seconds added or subtracted as needed to conform to earth's rate of rotation. The 24-hour clock coexists with the more common civil convention of counting the hours of the day from 1 through 12, repeated for a.m. and p.m. Designed to avoid confusion between a.m. and p.m., the 24-hour clock is widely used around the world for both military and civilian purposes, especially for operating transportation systems and global scientific observations like weather reporting. Clock- and watchmakers have made customized analog dials and digital displays for timekeepers to display the 24-hour clock.

The origins of the 24-hour clock lie in the idea of dividing the day into 24 equal hours, a time-reckoning method that Greek astronomers adopted in antiquity from revised Babylonian and Egyptian practices. For centuries, the 24-hour clock remained just one of several locally determined ways to divide the day. Gradually, beginning in the late 19th century, Western countries began to adopt the present 24-hour international system, coincident with efforts to introduce standardized global time zones and a prime meridian for the world.

Zulu Time

The prime meridian through Greenwich, England, or zero degrees longitude, governs time of day in its time zone and serves as an international reference time. The zone is designated with the letter Z, and "Zulu" is the word customarily spoken for this zone's letter to ensure clarity during radio and telephone transmissions. Greenwich Mean Time represents the time at the prime meridian, though outside of the United Kingdom UTC—which is broadly analogous—is often used in its place. For military operations that may cross time zones, the time at the zero meridian, rather than multiple local times, serves as a common reference for synchronizing all participants. The idea of assigning a letter of the alphabet to each time zone originated in the 19th century, when zones were first proposed.

Time and the U.S. Department of Defense

The U.S. Department of Defense (DOD) has a responsibility to find and maintain astronomical and atomic standards of time and time interval and to disseminate time information. This activity is part of the DOD's wider mission to provide aids to navigation for its own purposes and for operating the GPS. The U.S. Air Force manages the GPS constellation for DOD. The National Space-Based Positioning, Navigation, and Timing (PNT) Executive Committee, cochaired by the deputy secretaries of defense and transportation, coordinates the system.

The U.S. Naval Observatory (USNO) in Washington, D.C., is the official source of time for DOD and, together with the National Institute for Standards and Technology in Boulder, Colorado, is a standard of time for the civilian activities of the United States. One of the oldest scientific units in the federal government, the observatory operates a master clock in Washington, D.C., and an alternate master clock at Schriever Air Force Base (AFB) in Colorado Springs, Colorado. The USNO master clock is an ensemble of about 50 atomic clocks—cesium frequency standards and hydrogen masers—that contribute to UTC, the international time scale overseen by the International Bureau of Weights and Measures near Paris, France. About 300 atomic clocks in more than 70 national laboratories around the world contribute to International Atomic Time and to UTC, which is International Atomic Time plus or minus a leap second to ensure approximate agreement with the time derived from the rotation of the earth. These leap seconds are inserted on the advice of the International Earth Rotation and Reference Systems Service to which the USNO also contributes earth orientation data. USNO staff members provide the GPS satellites with time from the master clock, monitor the GPS signal at specialized stations, and provide the GPS air force managers with timing data from the GPS system. The observatory has provided time for military and civilian users since 1845, first with a time ball as a visual signal and later with telegraph, radio, and telephone time signals to listeners across the country.

Time and GPS

GPS became a fully operational one-way radio source for the world's most accurate time and location information in 1995. In addition to the USNO's

monitoring of GPS time, staff at the Naval Research Laboratory played a role in developing the space-qualified atomic clocks for GPS in the 1970s, as no atomic clocks had flown in space before the Naval Research Laboratory experiments, and the Naval Research Laboratory continues to test suitable atomic clocks for the program.

Clocks are fundamental to the way GPS works. With four satellites in view, it is possible for GPS users, military or civilian, to know continuously their altitude, latitude, and longitude to within a few meters and the time of day exact to within a few nanoseconds. Each GPS satellite contains a suite of atomic clocks, turned on sequentially only if necessary. Each is required to keep time to within a few billionths of a second. Each satellite transmits signals continuously to indicate its location in current time, and all the clocks are synchronized. The signals, emitted at different times, move at the speed of light and arrive at a GPS receiver's antenna on earth. The receiver calculates the distance to the GPS satellites by estimating the amount of time it takes for their signals to reach it.

in the said declaration read as follows: "We do not intend that the Japanese shall be enslaved as a race or destroyed as a nation, but stern justice shall be meted out to all war criminals, including those who have visited cruelties upon our [Allied] prisoners" (*Proclamation Defining Terms for Japanese Surrender*, July 26, 1945, para. 10). Eleven nations that had been at war with Japan took part in the international proceedings: (1) Australia, (2) Great Britain, (3) Canada, (4) France, (5) India, (6) the Netherlands, (7) New Zealand, (8) the Philippines, (9) the Republic of China, (10) the Soviet Union, and (11) the United States. Each participating Allied nation provided a judge, a prosecutor, and supporting staff. The U.S. government supplied additional lawyers, too, who assisted the Japanese defendants and their counsel to ensure equality between the prosecution and the defense. Joseph B. Keenan—formerly director of the criminal division of the U.S. Justice Department and assistant to the U.S. attorney general—served as chief prosecutor, while 10 other lead Allied prosecutors who joined the International Prosecution Section assumed the position of associate prosecutors. The president of the tribunal was Sir William F. Webb, chief justice of the Supreme Court of Queensland, Australia, and three-time chairman of the Australian War Crimes Inquiries (1943–1945).

Of some 100 major war crimes suspects whom General Douglas MacArthur—in his capacity as Supreme Commander for the Allied Powers—had ordered to be placed under house arrest or detained at Sugamo Prison in Tokyo, the International Prosecution Section chose 28 for the trial. The number of defendants subsequently diminished to 25 because of two deaths and one dismissal for the reason of mental unfitness to stand trial. The lead defendant was General Tōjō Hideki, former prime minister and concurrently war minister since the eve of the Pearl Harbor attack to the fall of Saipan (October 1941 to July 1944). Kido Kōichi—former lord keeper of the privy seal and personal advisor to Emperor Hirohito—was also one of the defendants. Hirohito himself was not among the accused, however, despite his assumption of tremendous power and authority as "head of the [Japanese] Empire, combining in Himself the rights of sovereignty" and "the supreme command of the Army and Navy" (Articles 4 and 11, *The Constitution of the Empire of Japan*, 1889). His absence from the courtroom

TOKYO WAR CRIMES TRIBUNAL

The International Military Tribunal for the Far East was established in Tokyo on January 19, 1946, pursuant to the Instrument of Surrender. The surrender document stipulated that Japan "accept[s] the provisions set forth in the declaration issued . . . on 26 July 1945, at Potsdam." The relevant provision

reflected the view of the United States and its allies that the Japanese emperor was as much a security problem as a legal one, whose trial, if it were to be held, could adversely affect the Allied occupation of Japan and, more generally, postwar peace and stability of the Asia-Pacific region. It remains a matter of controversy as to whether or not Hirohito should have faced trial along with his wartime advisors.

The principal charges against the 28 defendants were “crimes against peace,” namely, planning, preparation, initiation, and waging of aggressive war, or participation in a common plan or conspiracy to accomplish actions thereof. This category of offense

is presently known as the “crime of aggression” in the Rome Statute of the International Criminal Court (1998). The legal doctrine of crimes against peace was first introduced at the International Military Tribunal at Nuremberg (1945–1946), whose purpose was to set out a clear legal precedent that aggressive war constituted an international offense and that there was individual criminal liability for those who committed it. The Allied powers applied the same legal doctrine at Tokyo. The Charter of the Tokyo Tribunal, in fact, required that the principal charges against prospective defendants be crimes against peace. Consequently, much of the court case

Japanese war leaders are made to rise from their seats during their arraignment at the Tokyo Trials, which were held by the International War Crimes Tribunal for the Far East, in Japan.

Source: U.S. Army.

at Tokyo revolved around substantiating aggressive-war charges, although evidence of Japanese wartime atrocities was, in fact, also presented. The disproportionate emphasis that the Allied policymakers placed on crimes against peace had far-reaching consequences on the Japanese remembrance of the Tokyo Trial. The aggressive-war charges came to define the postwar debates on the trial, while the prosecution's evidence on war crimes—namely, Japanese military violence against Allied prisoners of war, civilian internees, and other civilian populations in Japanese-occupied territories—rarely elicited discussion for many decades.

The Tokyo Tribunal heard the prosecution's case between June 4, 1946, and January 24, 1947. The defense case began on February 24, 1947, and continued through January 12, 1948. The Tribunal adjourned on April 16, 1948, after hearing the rebuttal, surrebuttal, and summation of the two parties. The court reopened between November 4 and 12, 1948, in order for the tribunal to deliver the judgment. The decision was split among the majority opinion of eight justices, two separate concurring opinions, and three separate dissenting opinions. The majority of the judges found that all but one defendant was guilty of crimes against peace and that 10 of the 25 defendants—including the one acquitted of crimes against peace—were guilty of war crimes. The death sentence was meted out to 7 of these 10, while the remaining defendants received varying terms of imprisonment. In exercising his reviewing authority as supreme commander for the Allied Powers, General MacArthur subsequently confirmed all verdicts and sentences. The death sentences were carried out on the early morning of December 23, 1948.

The ones sent to the gallows included General Matsui Iwane, commander in chief of the Central China Area army, whose forces committed large-scale atrocities against Chinese prisoners of war and the civilian population in Nanjing (1937–1938); General Mutō Akira, chief of staff of General Yamashita Tomoyuki, who led the Fourteenth Area army and whose forces committed large-scale atrocities in the Philippines (1944–1945); and Hirota Kōki, foreign minister of Japan at the time of the Rape of Nanking. According to the Judgment of the Tokyo Tribunal, these three individuals were accountable for the respective instances of large-scale atrocity not so much because they ordered or authorized the

commission of war crimes. Rather, their convictions were based on the tribunal's findings that they knew, or should have known, that the Japanese armed forces were committing war crimes on a vast scale; that they had the power and duty to take such steps to stop the violence; but that they nevertheless failed to do so. The lead defendant, Tōjō Hideki, too, was convicted of war crimes as well as crimes against peace. The tribunal's main findings can be summarized as follows: that in his capacity as army minister, Tōjō authorized the exhaustive use of prisoner-of-war labor in violation of the Hague and Geneva Conventions (1907, 1929); that he tolerated widespread mistreatment of prisoners of war (e.g., during the construction of the Burma-Siam Railway); that in his capacity as prime minister, he continued the policy not to recognize prisoner-of-war status for enemy captives in the Chinese theater; and that he failed to discipline those commanders who were responsible for the Bataan Death March. Tōjō received the death sentence.

After the conclusion of these proceedings, the supreme commander for the Allied powers hosted additional trials of two high-ranking Japanese army and navy officers at separate courts in Tokyo (Toyoda and Tamura Trials, 1948–1949). Furthermore, individual Allied countries held more than 2,240 war crimes trials against some 5,700 suspects between 1945 and 1952. According to the Japanese government's data, the breakdown of the national trials is as follows: 456 American trials at Guam, Kwajalein, Manila, Shanghai, and Yokohama; 330 British trials in formerly Japanese-occupied British colonies in Southeast Asia, including Hong Kong, Kuala Lumpur, Singapore, and Rangoon; 294 Australian trials in several different locations in the South and Southwest Pacific as well as at Hong Kong and Singapore; 448 Dutch trials at 12 separate locations in formerly Japanese-occupied Dutch East Indies, including Batavia (present-day Jakarta); 39 French trials in Saigon; 72 Philippine trials in Manila; and 605 Chinese trials at 10 different locations in continental China, including Beijing, Nanjing, Guandong, Hankow, and Shenyang. The People's Republic of China carried out its own trials against select war crimes suspects in 1956. Data relative to the Soviet trials are unavailable except for a special military trial held in Khabarovsk in December 1949, where 12 Japanese army officers were convicted of charges that they had been party to developing and deploying bacteriological weapons.

The Tokyo Trial was a watershed moment in the history of modern Japan. It presented the Japanese people with a unique opportunity to examine voluminous oral and documentary evidence of the war of aggression and atrocities that were committed by the Japanese armed forces during the Asia-Pacific War (1931–1945). This trial, in this respect, marked a crucial starting point of the Japanese confrontation with war guilt, a process that continues to this day. The Tokyo Trial is an important event also in the field of international law. The tribunal delivered a landmark judgment that determined individual criminal responsibility not only of military commanders but also of state leaders for war crimes. Despite these important legacies, however, the prevailing view of the Tokyo Trial has been that of “victors’ justice.” Critics argued from early on that no justice could be achieved when the victor nations were the ones to plan and carry out the trial. The fact that controversial legal doctrines such as crimes against peace were introduced—with the result of guilty verdicts and life sentences to most accused—further reinforced the notion that the Tokyo Trial was nothing but a victors’ show trial.

Meanwhile, the blossoming of new international tribunals since the 1990s began to influence afresh the ways in which researchers assessed the historical significance of the Tokyo Trial and, more generally, that of World War II-era war crimes trials. International lawyers, in particular, paid special attention to the fact that a number of historical war crimes trials had handed down important rulings on theories of liability and that these rulings had immediate practical relevance to present-day international criminal trials. The growing consensus in recent years appears to be that while there is an element of truth in the “victors’ justice” perspective, the Tokyo Trial and other World War II-era war crimes trials helped build the foundation of the international criminal justice system. The challenge for future researchers is to carry forward both new and old lines of inquiry so as to produce a comprehensive assessment of the Tokyo jurisprudence.

TORPEDOES

Torpedoes are self-propelled underwater missile weapons designed for use against surface and submerged targets. They incorporate a warhead, propulsion source, steering mechanisms, and, in modern iterations, a guidance system.

Many of the characteristics associated with modern torpedoes originated prior to the end of the Second World War. The earliest successful models were built in three sections: (1) the warhead, (2) a central section containing a compressed air flask to power the torpedo, and (3) an after body with drive and steering mechanisms. These early weapons could follow a relatively straight path at a preset depth and depended on warheads fired by a simple impact fuse.

Designed initially for use by surface combatants, these early torpedoes were quickly mated with submarines once their inventors provided seaworthy platforms around the turn of the 20th century. German successes with the torpedo-firing U-boat during the First World War proved the combination's viability, and developers from many nations used the interwar period to improve the torpedo.

The modern torpedo is part of a weapons system, and much of the development after the Second World War focused on improving the other components needed to employ the weapon in addition to making improvements to the torpedo itself. Probably the most significant development of the interwar period was the development of an aircraft specifically designed to carry the weapon, the torpedo bomber.

New search sensors, fire control systems, and fusing mechanisms were available by the beginning of World War II. Ships and submarines carried active sonar to find targets and fire control systems to compute automatically the proper settings for their torpedoes. Torpedoes, with improved propulsion systems, received magnetic influence exploders that promised to increase the torpedo's destructiveness by allowing the weapon to target the most vulnerable part of a ship, the keel. In the end, the magnetic exploder needed additional work before it fulfilled its promise.

During the Second World War, warring navies added pattern-running torpedoes—zigzag or circular—for use against convoys, and by 1943, Germany and the United States deployed acoustic-homing torpedoes using passive sensors. Design of active sonar-equipped torpedoes required solution of significant technical problems. A few were produced during the war; none were used in combat.

The postwar period did not bring a slowdown in torpedo work. A warlike competition surfaced during the Cold War between the nations of the Warsaw Pact and the nations of the North Atlantic Treaty Organization. The West, having lost thousands of lives and spent millions in treasure winning the Battle of the Atlantic, worried about a growing Soviet submarine force based on captured German technology and engineers. The Soviets feared the West's sea power and its ability to use the torpedo to devastating effect.

Cold War competitors worked to perfect wartime advances and add new types of guidance and homing technologies to their torpedoes, including effective wire guidance and wake homing. While better antishipping weapons replaced torpedoes on surface combats, increasingly "smart" antisubmarine torpedoes replaced "dumb" ballistic weapons like depth charges and hedgehog bombs.

Longer sonar detection ranges prompted the creation of new torpedo systems able to capitalize on

the information. Antisubmarine rockets used rocket boosters to give torpedoes much greater ranges, and in those instances where the target's position was not known with great accuracy but ensured destruction was required, some torpedoes were equipped with nuclear warheads.

Other developments during this period resulted in rationalization of torpedo production into two general types: (1) heavyweight and (2) lightweight torpedoes. Modern submarines, nuclear and conventionally powered, were fitted with sophisticated dual role (antisubmarine and antishipping) heavyweight torpedoes incorporating wire guidance, improved digital acoustic sensors, advanced quieting to lower self-generated noise, and increased onboard computer processing power.

Lightweight torpedoes gave surface warships and aircraft a specialized antisubmarine weapon. These weapons used many of the technological advances incorporated in heavyweight torpedoes. Their ranges were shorter but acceptable, especially after shipborne helicopters, paired with sophisticated shipborne sensor systems, became available to deliver them. Their smaller warheads were enhanced through the use of shaped charges for targets particularly vulnerable to an explosive hull breach.

The Post-Cold War Period

Developmental efforts in advanced torpedo technology continued after the dissolution of the Soviet Union. The new Russian Federation continued work on Soviet designs for domestic use and for export sales. Some Western nations, principally the United States, the United Kingdom, Sweden, France, Italy, and Germany, also manufacture torpedoes, including some for the export market. Newer naval powers like China and India have indigenous manufacturing capability, though they sometimes modify designs purchased elsewhere.

The increased lethality of the torpedo has created a parallel interest in the development of effective countermeasures and automated detection systems. These devices vary in character from avoidance maneuvering and simple mechanical noisemakers towed in the wake of surface ships to autonomous electronic acoustic jammers and smart decoys. Naval designs now routinely incorporate degaussing systems and advanced equipment isolation and quieting techniques to defeat torpedoes'

magnetic and acoustic sensors. Defensive programs are also working on anti-torpedo torpedoes. Few torpedoes have been fired in combat since the end of World War II. Air-dropped torpedoes were last used during the Korean War to attack the Hwachon Reservoir dam after conventional bombing failed. The American destroyer, USS *Maddox*, was attacked by North Vietnamese torpedo boats in the Gulf of Tonkin, in 1964; and Israeli torpedo boats attacked the American surveillance ship, USS *Liberty*, in 1967. Four years later, the Pakistani submarine, PNS *Hangor*, sank the Indian frigate, INS *Khukri*. The British nuclear submarine HMS *Conqueror* sank ARA *General Belgrano* during the Falklands

War using a World War II-vintage torpedo, and the last attack employing a torpedo was the North Korean attack on the South Korean corvette ROKS *Cheonan* in the Yellow Sea in March 2010.

Though used infrequently, the lethality of modern torpedoes lends the threat of their use considerable potency. This is particularly true where the weapons are combined with modern quiet diesel-electric submarines or submarines using some form of AIP (air-independent propulsion) deployed in strategic shallow water locations like the Strait of Hormuz. Antisubmarine operations in such areas are extremely difficult and dangerous, and a successful attack against commercial shipping would have

An MK-32 Mod 15 Surface Vessel Torpedo Tube fires an MK-46 Mod 5 lightweight torpedo from the starboard side of the recently commissioned guided missile destroyer USS *Preble* (DDG 88) during a Combat Systems Ship Qualification Test on February 24, 2003. The MK-46 torpedo is designed to attack high-performance submarines and is considered the backbone of the Navy's AntiSubmarine Warfare inventory. USS *Preble* was commissioned on November 9, 2002, and is homeported in San Diego, California.

political, economic, and environment consequences out of proportion to the force applied.

Seeing little likelihood of major naval conflict, naval powers have stopped large-scale torpedo production, and future development will likely follow a program of gradual improvement to guidance, computer processing, propulsion, acoustic stealth, and sensors, especially to improve performance in the difficult littoral areas. This effort will be complemented by continued development of underwater battle space management systems designed to provide a real-time integrated tactical picture to military commanders.

TORTURE

Torture refers to physical coercion by state officials or their agents in order to generate evidence usable at trial. In addition to its evidence-producing function (that often does not produce reliable evidence or useful intelligence information), torture includes the deliberate infliction by government officials of physical and mental suffering to extract information unrelated to court proceedings. Resort to torture in the 20th century (and now the 21st) has typically been actuated by the second of these functions. This entry sketches the history of torture in Western society before turning to its modern-day manifestations and their relevance to military personnel.

Torture in the Ancient and Medieval Worlds

Until the time of the Roman Empire, neither the Greeks nor the Romans allowed the torture of free

men; instead, they restricted torture to slaves and sometimes to foreigners. This immunity of free men to official torture began to erode during the Roman Empire, when the emperor created an exception to facilitate the torture of free Romans in times of emergency. As imperial power expanded, so did the range of cases in which free Roman citizens could be subjected to torture.

Torture disappeared from western Europe after 500 CE, but made a comeback during the High Middle Ages. The return of torture was due to several factors, but abolition of trial by ordeal in 1215 may have been the most significant, insofar as it forced judicial officials to devise alternative ways to decide cases. The English turned to jury trials, while the Europeans employed inquisitorial methods. In both canon law and Justinian's Code, conviction was possible through only one of two means—the testimony of at least two eyewitnesses or the confession of the accused. Given the unlikelihood of multiple witnesses to a crime, confession became instrumental to conviction for serious offenses. When the accused declined to confess, Medieval judicial officials sought to extract the confession through torture.

Torture as a tool for securing confessions continued until the 18th century, when it became an object of opprobrium for the followers of the French Enlightenment. The abolition of torture in 1789 by the French revolutionaries was the culmination of decades of antitorture agitation, which deplored the practice as both cruel and irrational. Revulsion against *la question*, as it was called, continued throughout the 19th century. From 1929 until the German invasion of France in 1940, French police did employ a method of torturous interrogation resembling the American “third degree,” a practice called the *passage à tabac* (“rough handling”); however, French suffering under the Schutzstaffel (SS) and Gestapo torture during the occupation reaffirmed the nation's abhorrence of *la question*.

The Return of Torture: The 20th Century

In the 20th century, torture reentered Western history through two portals: (1) the rise of totalitarian states and (2) the formation of national security organizations tasked with gathering intelligence. The two 20th-century models of totalitarianism, Nazi Germany and Stalin's USSR, freely used torture as

a technique for securing incriminating evidence and military intelligence. Both governments overrode general guarantees of legal equality by appealing to alleged states of emergency that required extreme measures. From the onset of the Nazi government, a pattern quickly emerged of top-echelon government approval of torture carried out by Nazi auxiliaries (the Gestapo and the Sturmabteilung, or SA) on communists and socialists. The practice became routinized in the USSR by the 1930s, particularly in connection with Stalin's "show trials"—sham proceedings designed to railroad Stalin's political enemies into false convictions.

Democracies have also revived the institution of torture, primarily in the post-World War II period. Under General Jacques Massu, the French army in Algeria conducted a secret program of torturous interrogation and "disappearances" of suspected insurgents. The preferred method of torture was the *gégène*, in which electrodes were attached to body parts—especially the penis—and the detainee shocked with electricity. Other techniques included variations on "water torture"—plunging prisoners' heads into barrels of water or pumping their stomachs and lungs full of cold water with a hose. Like the French, the United States has employed torture at various times and places since 1945. It appears to have grown out of Central Intelligence Agency interest during the 1950s in gleaning intelligence through psychotropic drugs and sensory deprivation. Psychological forms of torture yielded to more physical techniques during the Vietnam War, reaching their apex in the Phoenix program of the United States. Congressional hearings into Central Intelligence Agency excesses in the 1970s curtailed the practice, setting the stage for the UN Convention on Torture and its codification in U.S. law.

Torture Under International and U.S. Federal Law

The irony of the modern revival of torture is its coincidence with efforts to make it illegal, both domestically and internationally. The Nuremberg jurisprudence had defined torture as a crime against humanity in the mid-1940s, and by the end of that decade, two instruments affirmed the illegality of torture under international law: (1) Common Article 3 of the Geneva Conventions, which proscribed "cruel treatment and torture" under all circumstances; and

(2) Article 5 of the Universal Declaration of Human Rights (formalized as a treaty, the UN Covenant on Civil and Political Rights), which banned "cruel, inhuman or degrading treatment or punishment." The UN Convention against Torture (1987) extended these earlier prohibitions with a detailed definition of the offense. Moreover, the convention denied justification of torture on grounds of duress or exceptional circumstances, banned "extraordinary rendition," and affirmed a duty to investigate and to prosecute alleged instances of torture. Finally, it rejected the legality of "cruel, inhuman, or degrading treatment or punishment" falling short of torture (Article 16).

As a signatory to the UN Convention, the United States codified the prohibition of torture in 1994. Section 2340 of the U.S. Code makes torture a criminal act under U.S. federal law. Its definition of torture is capacious, banning not only intentional infliction of "severe mental pain or suffering" "under color of law," but "threatened infliction," seeking to disrupt the "senses or the personality," or threatening imminent death. Congress reaffirmed the illegality of torture under U.S. law with passage of the War Crimes Act of 1996 (18 USC §2441), which incorporates the proscription of torture found in Common Article 3 of the 1949 Geneva Conventions.

Conclusion

Despite these condemnations of torture under international and U.S. federal laws, the American government sponsored interrogations in connection with the Global War on Terrorism that employed torture. (From all accounts, George W. Bush administration officials endorsed the first Central Intelligence Agency-administered torture of a "high-value" detainee, Abu Zubaydah, in the spring of 2002.) As of this writing, no government official has been held legally accountable, and only a handful of the lowest ranking military personnel in the long and involuted chain of command have been prosecuted. Nonetheless, torture remains a grave offense under military law, international law, and U.S. domestic law.

TOTAL WAR

Total war is a concept of warfare long associated with the theories of the 19th-century German strategist Carl von Clausewitz. Total war is limitless in its scope, with all belligerents using all possible resources to break the will and capacity of their enemy to resist. Total war is recognizable in the fact that the distinction between the combatants and noncombatants is blurred as all the resources of the participant states are mobilized to conduct the conflict.

Total War in Theory

Although total war in practice can be traced back to the ancient Greeks, it is Clausewitz who first sets out the idea of total war in theory. After the First World War, Clausewitz was heavily criticized as the inspiration for the large-scale destruction that marked the conflict. When Clausewitz speaks of total war, he talks of the concepts of Absolute or Ideal war. (Clausewitz used the term “total war” only once in his writings *On War*.) To Clausewitz, total war is war in a vacuum without the traditional influence of politics or society, which tends to be a limiting factor on the conduct of war. Clausewitz states that war is an act of force, and there is no logical limit to the application of that force because, in absolute war, the war is indivisible from its component parts.

Napoleonic Wars

The Napoleonic wars represent the transitional era between the dynastic wars between kings that preceded them and the world wars of the 20th century that followed them. The Napoleonic era was also Clausewitz's era, and from this period, he drew inspiration and illustration for his theories. The

basis of the Clausewitzian theory of absolute war (total war) can be clearly seen in the great innovations of the Napoleonic age. The first of these, *levee en masse*, referred to by Clausewitz as the nation in arms, marked the end of the small, professionalized armies of Europe. The citizen armies of the new French Republic took Europe by storm. The strength in numbers and motivation of the French troops was far superior to that of the mercenary and usually much smaller forces of the European kingdoms. The French Revolution signaled the birth of nationalism, an essential ingredient for the conduct of total war. The French Republic introduced conscription, to varying levels of effectiveness, thus breaking down the barriers between civilian society and the military.

American Civil War

The American Civil War took the next step toward total war. The war continued for 5 years, costing more American lives than any other conflict involving the United States. The conflict was mismatched from the start. The Union had 70% of the population and 70% of the railroad miles, as well as 90% of the manufacturing industry.

As a consequence, 95% of those eligible for military service in the Confederacy spent some time serving in the forces. The industrial complexes of the Confederacy were placed on a total war footing, and it was by this shift to total war that the Confederacy was able to continue the conflict for such a surprising length of time. The truly Herculean task of the Confederacy was helped by the excellent work of Josiah Gorges, who served as the quartermaster and chief of staff for the Confederate armies. In total war, the ability to marshal resources and use them optimally is as important, if not slightly more so, than the ability to win individual battles. It is no secret that the outcome of the Second World War, and arguably the First, was swung by the input of American economic strength.

Although the demands of the conflict weighed heavily on the Confederacy, fighting as it was for its continued existence, the situation was by no means as severe in the Union. The Union's economic and manpower advantage meant that the civilians in the Union who lived away from the conflict areas could stay relatively removed from the impact of the war (or as removed as they could be in a civil war

that divided a nation against itself). This was partly because the Union was not fighting for the existence of its state or for its distinctive way of life but fighting to return the rebel states to the Union.

However, the Union did introduce many aspects of total war into the conduct of the conflict. General Philip Sheridan's burning of the Shenandoah Valley and General William T. Sherman's destructive march to the sea represented a conscious use of total war tactics to target civilians and the enemy's will to fight. This signaled the changing nature of conflict wherein the destruction of infrastructure and will to fight becomes more important than the destruction of armies. The Confederacy lost a number of armies during the conflict, but it was not until the Union focused on the destruction of the Confederacy's resource base that it prevailed. For many historians, the American Civil War represents a chilling portent

of the future destructive power of total war as shown by the two world wars of the 20th century.

World War I

The First World War marks the first of the two total war conflicts of the 20th century. World War I dwarfed anything that had preceded it, earning it the title of "the war to end all wars." For the first time in military history, field armies could number in the millions. A key feature in creating armies of this size was the introduction of conscription in most armed forces, even the British abandoning reliance on volunteers in 1916.

With traditional factory workers being drafted into the military, there were fewer skilled workers to produce the essential goods required for the pursuit of warfare. For that reason, many women were

An 1883 drawing by F. O. C. Darley depicting Sherman's March to the Sea. Soldiers are seen destroying railroad tracks and telegraph poles and burning buildings.

Source: Courtesy of the Library of Congress.

employed in armaments factories and other essential industries. This was a historic step in British history, and at the end of hostilities, voting rights in parliamentary elections were extended to women for the first time, partly in recognition of the work done by women in the conflict. War was truly touching all sectors of society, with the British aristocracy weakened by the loss of much of its youth and, in some cases, villages losing almost all their young men.

There was no reason for those civilians not living near the front lines to fear that they would be killed by the instruments of conflict, such as bullets or bombs. Occasionally, some coastal towns were shelled by passing enemy battleships, but in the main, civilians were immune from the direct impact of the fighting, especially in Britain where civilians did not need to fear the unexpected arrival of the enemy in their towns.

However, the diversion of resources to the war effort did have a severe impact on the lives of civilians during World War I. European nations experienced shortages of food and raw materials, and toward the end of the war, Great Britain introduced rationing to ensure that its citizens would not go hungry.

The First World War was a further step toward the realization of theoretical total war as outlined by Clausewitz. However, it did not quite attain this level as the civilian noncombatant was not deliberately attacked. The full resources of the states were focused on avoiding defeat, but the overall destruction of the enemy state was not desired by the participating nations, as shown by the Treaty of Versailles.

World War II

Many historians consider the Second World War to be the realization of total war. The mobilization of resources, both civilian and military, the size of the battlefields and armies fighting on them, the total disregard for civilian life and property, and the unrestricted aims of the Axis nations (Germany, Italy, and Japan) all point to total war as Clausewitz had envisaged it.

Mobilization of Resources

Every resource of a nation was used as never before in an attempt to gain victory during the Second World War. Britain, having learned from the experience of the First World War, immediately implemented a total war posture and introduced

conscription in April 1939, even before war began. Women were once again mobilized for service in factories and to work the land. The Soviet Union successfully undertook the unprecedented move of relocating its entire industrial base east to avoid the invading Germans. Germany was the only nation to officially embrace total war, but not until 1943, with women previously prohibited from factory work or service in the military.

Size of Armies and Battlespace

The size of the armies involved was again a step up from anything that had come before it. The German army that invaded the Soviet Union consisted of almost 4 million men, and an estimated 8 million Soviet military personnel died in the war. The battlespace was made larger by the technological advances of the age. The tank made it possible to travel long distances to fight, and planes made it easy to strike deep behind the front lines. At the Battle of Midway, the opposing fleets were separated by hundreds of miles and the battle was fought from the air.

Disregard for Civilians

The war was marked by a distinct lack of concern for the welfare of the noncombatant. The German Blitzkrieg deliberately forced refugees onto the roads in an attempt to disrupt enemy military traffic. The Blitz also targeted civilians, aiming to compel them to surrender. The Allies replied in kind, the most obvious example being the controversial bombing of Dresden. The destruction of property was also unabashed. The historic monastery at Monte Cassino in Italy was destroyed, as was England's Coventry Cathedral.

Unconditional Surrender

The policy of unconditional surrender was also a key factor in the pursuit of total war. Because the surrender was expected to be unconditional, it was very difficult for any side to conclude a compromise peace or to surrender without having exhausted all their strength to gain victory.

Nuclear Weapons and the End of Total War

The Second World War was brought to an end by the atomic bombs dropped on Hiroshima and Nagasaki. This act also brought the era of total

war to an end. Since 1945, no Western nation has mobilized all its resources in an out-and-out battle for victory. To do so would be pointless. The use of nuclear weapons could only result in a hollow victory, with mass civilian deaths and irradiation of the earth eradicating any gain. In fact, total war without nuclear weapons only results in hollow victories: Britain became penniless and empireless as a result of the Second World War, most of Europe was destroyed and bankrupt, the rule of communism in Russia and Eastern Europe was secured for the next 45 years, and America was saddled with the debt of Europe. For the aggressors in World War II—Germany and Japan—the conflict led to abject destruction and their occupation by foreign powers for years afterward.

The Civil-Military Divide and the Future of Total War

At the end of Chapter 3 of Book 8 of *On War*, Clausewitz asks whether the total war of the French Revolution would continue to be a model for world conflicts or whether a gradual separation between military and people would again be seen. More than 180 years since Clausewitz's death, we are now in a position to answer his question. The era of total war continued for 130 years following the end of the Napoleonic era. The deployment of nuclear weapons at the end of the Second World War changed the complexion of future military conflicts. The use of the full power of a nation in a conflict, when armed with nuclear weapons, became anathema. If it is likely that both sides will lose in a total war conflict, the example of Britain and the British Empire following the Second World War being a good illustration, then in a nuclear war, this result becomes a near certainty. Since the explosion of a Soviet nuclear weapon in 1949, the involvement of civilians in a Western country's wars has been limited, with perhaps the exception of those drafted to serve in Korea or Vietnam. In many countries, the military has become more and more institutionalized and separate from the society it serves, having once again become the relatively small band of specialists it was before the wars of the French Revolution and Napoleon. Perhaps this cycle will repeat and we will again see total war, but, for a time at least, total war is a thing of the past.

TRAINING, AIR FORCE ENLISTED

In 1947, the U.S. Air Force officially broke away from the U.S. Army, becoming a separate branch of the U.S. military. No longer bound by the army way of doing things, the air force developed its own set of regulations and procedures for training and educating recruits. Today, the process of training and educating those who enlist requires a strict minimum of eight weeks, during which time enlistees can expect to have both their physical and mental states challenged. After this initial training, on-the-job training commences. Throughout, the goals of the air force remain the same: to instill recruits with technical skills, self-confidence, teamwork, emotional stability, and physical endurance.

Background

Air force training started at Lackland Air Force Base (AFB) in the 1930s on what was then called Kelly Field, with Brigadier General Frank D. Lackland in charge of expansion and training. At the time, the main concern was to train men to become pilots in the Army Air Forces. After the bombing of Pearl Harbor on December 7, 1941, the need for cadets grew exponentially as the effort to use precession bombing tactics throughout World War II required more bombardiers, pilots, and navigators. Soon, the influx of recruits began to outgrow Kelly Field, and in 1941 construction began on the San Antonio Aviation Cadet Center (SAACC). After the war, though, admissions dropped significantly and the SAACC ceased to exist.

On September 18, 1947, the U.S. Air Force became an independent branch of the U.S. military

with the implementation of the National Security Act and the swearing in of Stuart Symington as the first secretary of the air force. Now reopened and renamed, Lackland AFB became “the gateway to the air force” for all enlisted personnel. Here, the air force trained the airmen who participated in the Berlin Airlift and the Korean and Vietnam Wars. Also, until 1962, Lackland AFB provided a channel through which enlisted personnel, such as commissioned college graduates with no prior service and airmen possessing undergraduate degrees, could enter the air force or its Officer Training School. In 1993 the Air Force Officer Training Corps was moved to Maxwell AFB, Alabama, but even today Lackland AFB remains the site where all air force cadets enter and train.

Types of Training

The air force basic training center, located in San Antonio, Texas, serves to acclimate male and female recruits to military life, both physically and emotionally. Ideally, basic training imbues men and women not only with a feeling of self-worth but with a certain pride stemming from their participation in America’s defense and technological systems. Increased from 6½ weeks to 8½ weeks in 2008, basic training strives to teach the fundamentals of air force service, including confidence, academic performance, physical stamina, and marksmanship. Recruits also receive special aid and guidance in choosing an occupation that will work well with both the candidate’s strengths and the needs of the air force. After graduation, trainees progress to the second step of the training process.

Basic training graduates go directly to Technical Training Centers for formal in-state residence training conducted in places such as Keesler AFB in Biloxi, Mississippi, and Sheppard AFB in Wichita Falls, Texas. In a classroom setting and during practice sessions, the new airmen learn the basic skills needed for specialties such as radar systems, computer systems, survival training, and aerial gunnery. After three months at their first permanent duty station, airmen enroll in various courses to learn their job functions, operations of the air force, technical orders, and directives to learn a specific task. After the airman’s day is finished, he or she must study and prepare outside of the set training schedule to excel. Airmen are not left alone in their job learning

experience. Supervisors teach and train the airmen with a hands-on approach. Developing these skills and succeeding in training transforms the young airmen into skilled noncommissioned officers (NCOs).

The Civil Air Patrol, while an independent civil organization, is strongly supported by the U.S. Air Force. Air force personnel are assigned to the congressionally chartered volunteer organization that serves as an important conduit for enticing young men and women into considering the air force. The Air Force Junior Reserve Officers’ Training Corp (JROTC) serves as another venue for inculcating young people with the ethos of the air force and an interest in aviation.

Developments in Training

As new technology emerges, the air force adapts its training, making necessary course changes. Recruits are now certified in chemical and biological warfare defense. Also, all new recruits have to participate in a rigorous physical training program. The air force has doubled its physical fitness requirements, going from three workouts per session to six. Workouts include a timed 2-mile run, push-ups, sit-ups, and leg lifts. At Scorpion’s Nest, an encampment where recruits are taught the ins and outs of field operations and living, airmen are exposed to the elements that they may encounter during their tours of duty. They are taught camp security, what to do under fire, camouflage techniques, and the importance of controlling light, noise, and trash. The air force recently extended these events into a full week called Warrior Week. The instructors find it to be a critical exercise in the physical and mental development of what it means to be in the U.S. Air Force. As of 2008, two additional weeks of basic military training were added to include Basic Expeditionary Airman Skills Training (BEAST) to acclimate airmen to the conditions they might experience when deployed.

Air force data on basic training at Lackland AFB reveal that the failure or “washout” rate for recruits for fiscal year 2010 was only 5.7% out of the 42,000 who enlisted. This was a great improvement over previous years. From 2004 to 2008, some 8% washed out, and in 2007 more than 10% did. In large part, higher retention rates are a result of the air force’s decision to lengthen the training cycle from 5 to 8½ weeks. In 2009, the first year of the training overhaul, the failure rate was only 6.3%.

This has proved very important not only because the air force benefits from having more and better trained recruits but because the retention of candidates reduces expenditures. It costs \$46,000 to train each new recruit, money wasted if they fail to complete the program.

in its space and cyberspace missions, aerial flight remains the service's primary area of emphasis. To provide qualified officers to operate its aircraft, the USAF has devised a rigidly defined process to screen, select, train, and continually develop pilots for myriad missions and airframes. The USAF Major Command responsible for this program is Air Education and Training Command (AETC). The USAF's process for selecting and training pilots is considered to be among the world's finest and is the model for a number of other countries' programs. The initial training of USAF pilots is formally known as Undergraduate Pilot Training (UPT).

Selection

Competition to become a pilot in the USAF is keen, and the level of interest in pursuing this goal remains extremely high—not only for those seeking a commission in the USAF but also among members of the general public. The formal selection process begins in the three primary commissioning sources for USAF officers: (1) Air Force Reserve Officer Training Corps (AFROTC), (2) the U.S. Air Force Academy (USAFA), and (3) Air Force Officer Training School (OTS). As a result of an improved and more stringent selection process instituted in the years following the end of the Cold War, the washout rate among student pilots has fallen dramatically.

For cadets enrolled in AFROTC, the first step toward earning their wings is the completion of the Air Force Officer Qualifying Test with high scores—particularly high scores in the “pilot” section of the test. From here, AFROTC cadets interested in becoming pilots are required to complete the Basic Aptitudes Test, which is designed to gauge individual ability to operate the controls of an aircraft. Once the Basic Aptitudes Test is completed, pilot candidates are selected from among those AFROTC cadets who are interested, are medically pilot qualified, and have the most competitive physical fitness, Air Force Officer Qualifying Test and Basic Aptitudes Test scores, highest GPAs (grade point averages), and strongest recommendations. For OTS trainees, the process generally follows that prescribed for AFROTC cadets, though it can begin during the selection process for OTS itself.

For USAFA cadets, the process is no less arduous, though in recent years, USAFA has not filled its allotted quota of training slots, as cadets increasingly

TRAINING, AIR FORCE PILOTS

The U.S. Air Force's (USAF) primary mission is to “fly, fight and win” in air, space, and cyberspace. Though the USAF is experiencing dramatic growth

seek career field assignments in areas more directly transferable to the business world. For those USAFA cadets wanting to be pilots, selections are made based on desire, GPA, physical fitness, recommendation of their Air Officer commanding, and passage of a stringent medical examination.

Initial Flight Screening and UPT Bases

New second lieutenants selected for pilot training report to initial flight screening at Pueblo Memorial Airport in Pueblo, Colorado. Initial flight screening is designed to provide students with basic flight instruction and the associated academics to prepare them for UPT. More specifically, the fast-paced nature of instruction at initial flight screening provides an opportunity to evaluate whether or not a student is equipped to handle the coming rigors of UPT. Those unable to cope with the pace of instruction are eliminated from the UPT process.

UPT takes place at one of four Air Education and Training Command Air Force Bases (AFBs) or at designated Naval Air Stations through a joint program with the Navy, Marine Corps, and Coast Guard. All USAF UPT bases are located in the southern third of the United States: Columbus AFB, Mississippi; Laughlin AFB, TX; Sheppard AFB, Texas; and Vance AFB, Oklahoma. On arriving at their designated base, pilot trainees are assigned to a Flying Training Squadron that will be their home through the primary phase of training.

Primary Phase

All primary phase UPT takes place in the T-6 Texan II Joint Primary Air Training System, a single-engine, turboprop aircraft that seats student and instructor in tandem. Instruction includes practical experience in the principles of flight, operation of the aircraft, safety, formation flying, instrument flying, ramp operations and taxiing, takeoff and landing, flight in the air traffic pattern and local area, cross-country flight, and emergency procedures. The program of scheduled, predefined flight scenarios that is flown by the student is known as the “syllabus.”

During the primary phase, students are continually evaluated on their academic and practical skills. After a series of flights and successful completion of an instructor evaluation flight, commonly known as a “check ride,” the student pilot is permitted to fly the aircraft alone, commonly referred to as the

“solo” flight. After soloing, the student continues to receive instruction in the operation of the aircraft, flies solo, in formation, with an instructor, and begins to develop the skills needed to operate a more complex aircraft until completing the syllabus for the T-6. In the final stages of the T-6 syllabus, the student is placed on one of the USAF’s airframe and mission tracks: the tanker/transport track, fighter/bomber/reconnaissance track, and the helicopter, or rotary, track.

Advanced Phase

On entering the advanced phase training, student pilots are assigned to a new squadron and begin a more focused syllabus. The majority of USAF student pilots are assigned to the tanker/transport track or the fighter/bomber/reconnaissance track. For the tanker/transport track, students in the USAF pilot training program complete their advanced flight syllabus in the T-1 Jayhawk, a twin-engine jet similar to many small corporate jets, where the student and instructor are seated side by side, with additional seating available in the passenger compartment. For some tanker/transport students, many of whom are slated to become C-130 pilots, the advance phase will take place in the T-44 and TC-12 twin-turboprop aircraft at Naval Air Station Corpus Christi. Training in the tanker/transport track prepares pilot trainees to manage a large airframe over long distances, in all types of weather conditions.

Students selected for the highly competitive fighter/bomber/reconnaissance track complete a training syllabus in the T-38 Talon, a twin-engine jet capable of supersonic flight, which resembles a 20th-century light fighter jet, and seats the student and instructor in tandem. Training in this aircraft prepares pilot trainees to operate in all manners of flight and at the edge of the performance envelope.

A smaller number of students are placed on the rotary track and proceed to Fort Rucker, Alabama, where they receive instruction in the UH-1 helicopter from the U.S. Army. Graduates of the rotary track can be assigned to operational squadrons flying the UH-1 and HH-60 helicopters or the CV-22 tilt-rotor aircraft. While part of a smaller community, many of the pilot trainees selected for this track are eventually assigned to Air Force Special Operations Command, where they can expect to execute particularly intense flight operations.

On completion of the advanced phase of training, all student pilots receive their aeronautical rating, wings, and membership in an elite fraternity of professionals. From here, these new pilots proceed to training on a specific airframe in preparation for joining an operational USAF flying squadron. Some of the new pilots remain in Air Education and Training Command to serve as first assignment instructor pilots after completion of Pilot Instructor Training at Randolph AFB, Texas.

Formal Training Unit and Continuing Development

The majority of new pilots report to one of several Formal Training Units (FTUs) throughout the USAF to receive training on their assigned airframe. It is in this advanced stage of training that new pilots learn how to put the flying skills they acquired in UPT to use in an operational environment. The FTU teaches students to fly as participants in USAF operations, both in peace and war.

Although the initial process of training USAF pilots ends when they receive their wings at their graduation, or “winging” ceremony, training will continue throughout a pilot’s career. For all pilots, constant training, regular evaluations, and continuing formal courses are hallmarks of a USAF pilot’s career. In fact, USAF pilots spend more hours in the air and on-the-ground training than they are likely to spend in or supporting combat. For some pilots, combat or combat support is something they never experience.

Comparison With Other Services

Since the early 1990s, the USAF and other military services have been working to meld their pilot training programs into a more consistent and coherent process, though the USAF and Navy still maintain their own distinct programs. As a result of these efforts, the differences between the two programs have diminished. In fact, many air force pilot trainees complete their basic phase through the Navy’s program, and vice versa, suggesting that there remain few practical differences between the two programs. In the coming years, given shrinking military budgets and increasing number of joint operations, it is likely that the separate service training programs will be merged into a singular program at the basic level; similarly, at the advanced level, training for the

fighter/bomber/reconnaissance and tanker/transport tracks will be merged with the other services in a fashion similar to that employed by the air force with its rotary track.

TRAINING, ARMY ENLISTED

Training is of vital importance to every military organization. What training is, what to train on, how training is conducted, what needs to be focused on, and who is to be trained are the central issues that face the military. Simply stated, training enables a soldier to fight and win, which is the basic mission of the U.S. Army. Today, the forces that constitute the military of the United States arguably are both the best trained and the best equipped in history along with possessing extremely high morale as a result of the nation’s investment. For today’s army, basic training provides not only a grounding in the fundamental skills of soldiering but also teaches prospective soldiers to prepare for the nation’s individual conflicts. A “train as you fight” mind-set remains the central theme of modern training.

History

From ancient times, drill centered on moving the unit as a cohesive force and closing with the enemy and destroying it. The Greek phalanx and later the

Roman legion required each man to maintain his position in the formation to prevent a collapse and defeat of the unit. Using a combination of sword, shield, spear, and bow, ancient armies defeated their enemies. Even as late as the Civil War, the musket with its limited effective range was the primary infantry weapon. Operating within its functional ability, the musket needed a formation to lay down a wall of fire to destroy the opposing formation. Only training could mold a conscripted army into an effective fighting machine. British enlisted men feared their officers and noncommissioned officers more than their enemy. However, with the advent of the rapid-fire rifle, there was a fundamental change in warfare and hence the training necessary to achieve victory. Combat leaders, as usual, failed to comprehend how modern technology was influencing how warfare was conducted. Even as late as World War I, soldiers trained in an outmoded manner and the results on the battlefield were disastrous. Modern weapons such as the machine gun and rapid-fire artillery cut down troop formations easily. As in the American Civil War, military leaders of the time failed to comprehend the effect that technology had on warfare. The U.S. Army continues to use Field Manual (FM) 22-5, *Drill and Ceremonies*, to instill discipline in new recruits and move soldiers in a formation from place to place. Despite the use of strict, linear formations for establishing discipline, military training today is geared to meet the present threat and develop effective means with which to counter these threats.

The manner in which a soldier trains will be reflected in the way he or she engages his or her enemy on the battlefield. Training provides both the knowledge and the basic skills a soldier needs to carry out assigned missions in a competent manner.

Until the end of the 20th century, the U.S. Army had a rigid system of training for its soldiers—the Army Training Program (ATP). The Army Training and Evaluation Program (ARTEP) and the Individual Training and Evaluation Program (ITEP) set the standards to meet the exigencies of modern combat. The standards are continually revised to include new threats, such as improvised explosive devices. Most deaths and wounds to American military personnel are a result of improvised explosive devices. Today, the fundamentals of both individual and collective training are the “Five Ps”—planning, preparing, presenting, practicing, and performing. Following

the “Five Ps” can make the difference between life and death when dealing with the danger posed by improvised explosive devices.

Each service has a different metric for establishing its initial training standards. The U.S. Army still has a basic training standard of 9 weeks. Those who serve in the combat arms, such as armor, infantry, or artillery, have One Station Unit Training, which combined with basic training lasts 16 weeks. Additionally, different Military Occupations Specialties (MOS), such as the medical and administrative, have varying lengths of Advanced Individual Training (AIT). The Marine Corps has a 12-week basic training cycle, the navy training cycle consists of 8 weeks of boot camp, and the air force uses an 8½ week initial training cycle.

Lieutenant General Arthur S. Collins Jr. was a major force behind the revamping of army training during the 1960s and 1970s. He was a West Point graduate in 1938 and was a combat leader at the divisional level during World War II. He spent a great deal of his later army career in the planning and training of U.S. Army forces. He understood that there were fundamental flaws in the manner in which the U.S. Army planned and trained for combat and sought to rectify these issues. He had a philosophy concerning training that was reflected in his book *Common Sense Training: A Working Philosophy for Leaders* initially published in 1978. He believed that training was composed of four requirements. These were soldiers, equipment, a training area, and, last, a state of mind. He believed that the last, spirit and mind, were intangibles and thus the hardest to acquire.

In the early 1950s, the army focused on the decentralization of training. Unfortunately, this concept meant different things to different leaders throughout different parts of the army. Training was often accomplished to satisfy a requirement and was not representative of the threat represented by the Soviet bloc. Unrealistic training led to difficulties fighting irregular forces in Vietnam.

During the Vietnam War, the needs of the rest of the army were subordinated to the needs of the forces engaged in combat in Southeast Asia. Training suffered because units throughout the army were little more than training and replacement depots for Vietnam. The attrition caused by combat losses in the war zone meant a loss of cohesiveness as many of the best combat leaders faced numerous

rotations as replacements. Noncommissioned officers, the backbone of enlisted training, were in short supply and had insufficient time prior to their reassignment to the war zone to effectively train and mold their units. This, combined with the maladies of drug abuse, racial conflict, and the indifference of many of the draftees, created an atmosphere that negatively influenced the readiness of the U.S. Army. Many described the army during the early years of the post-Vietnam era as “hollow” and not ready should another war erupt. Many believe that today training has suffered as a result of the continuous demands over the past decade caused by the wars in both Iraq and Afghanistan.

After Vietnam, the army instituted a realistic training program suited to specific missions of units. All units received training in physical fitness along with weapons familiarization. The army instituted what came to be known as “prime time” training where for a specified number of hours per week, training was conducted at the unit level. During the 1970s, training also became more centrally controlled. The army conducted numerous divisional-level schools, where soldiers could be sent away from their assigned unit and receive army-wide standard training on post. These courses were supposed to be the foundation of developing the individual soldier. Unfortunately, often the unit would send individuals incapable of successfully completing the training at these schools instead of their best soldiers, claiming that these soldiers were essential to unit readiness and could not be spared. The soldiers the army needed to train the most did not attend and hence were not as well equipped to disseminate their knowledge to their enlisted subordinates. Unfortunately, many of these substandard soldiers received promotions to higher grades because of this training, and the more highly qualified but “could not be spared for schooling” became discouraged.

The focal point of this centrally controlled training was the U.S. Army Training and Doctrine Command (TRADOC), established in 1973. TRADOC was created by the senior leadership of the army to respond to the continually changing nature of modern warfare and to learn from the lessons of the Vietnam conflict. TRADOC controlled all phases of military training from basic training to service schools, and brigade rotations to major training centers such as Fort Irwin, California, and

Fort Polk, Louisiana. There, soldiers developed skills to enable them to prepare for the perceived threats of the future. TRADOC is responsible for the development of warfighting doctrine throughout the U.S. Army. This was accomplished under the constraints of both the budget and threat level presented by possible and acknowledged adversaries worldwide. The Army National Guard and the U.S. Army Reserves also fall under the aegis of TRADOC for purposes of enlisted training. In recent years, both the National Guard and the reserves began receiving up-to-date equipment rather than obsolescent materiel from the Active Component. Considering the numerous deployments of each, in retrospect, this was an insightful decision.

By the mid-1970s, a new term came into vogue within the army—*collective training*. The training of crews and small units to operate in a cohesive manner became paramount. Change has been the code word of the U.S. Army as it transforms itself from the traditional division to the brigade combat system by which units are being deployed to Afghanistan.

All enlisted soldiers are trained to react on making initial contact with an enemy force by relating the size, activity, location, unit, time, and equipment (SALUTE) of the force to the next level of command. This is stressed in individual- and unit-training scenarios. The information relayed through the chain of command will assist in a proper riposte by U.S. forces.

During the 1970s, the Multiple Integrated Laser Engagement System (MILES) came into use. It provided a realistic assessment of how effective weapons systems were. It could be used from individual weapons to the main guns of the M-1 Abrams Tank. The army conducted large-scale brigade exercises at locations such as the National Training Center at Fort Irwin, California; the Joint Readiness Training Center at Fort Polk, Louisiana; and the Combat Maneuver Center at Hohenfels, Germany. However, the majority of this training was predicated on a conventional enemy force such as that of the former Soviet Union. Although this was effective against the conventional threat posed by the Iraqi army in both the Persian Gulf War and the Iraq War, this training failed to prepare the U.S. Army for the irregular asymmetrical conflict that was to follow.

Additionally, during the 1980s, a new training paradigm came into being. “Prime Time Training” became the standard element of army-wide

unit-training schedules. Generally speaking, either a morning or an afternoon was devoted to training the unit. Certain core subjects would be taught throughout the army, such as first aid, operating in a contaminated area, and vehicle and aircraft recognition. This time could be also devoted to unit-specific training, such as a personnel services company operating in a field environment or a medical supply organization doing likewise.

As a result of TRADOC's effort, the U.S. Army has revised both FM 100-5, *Operations*, and FM 25-100, *Training the Force*. Because of the terrorist attacks of 9/11, there has been an increased emphasis on training enlisted personnel in languages at the Defense Language Institute at the Presidio in Monterey, California, as well as sending them to the U.S. Army

Chemical School at Fort Leonard Wood, Missouri, to cope with chemical, nuclear, and biological threats.

A prime example of how training has evolved over the years is physical fitness training. Years ago, physical fitness consisted of the "daily dozen" consisting of push-ups and sit-ups along with other exercises intended to develop strength along with a run. The physical fitness test also consisted of a grenade throw. The army realized that the vast majority of soldiers would never use a grenade in combat except for the infantry. Today, fitness is designed to be more practical. It consists of stretching, so that muscles adjust prior to the start of an exercise routine. Running builds up stamina for the rugged terrain in Afghanistan, while weight training develops the upper body strength necessary in today's

U.S. Army soldiers from Charlie and Delta Company, 1st Battalion, 175th Infantry Regiment, Maryland Army National Guard combine efforts July 24, 2007, during a joint urban cordon and search exercise as part of the army readiness and training evaluation program in the mock city of Balad at Fort Dix, New Jersey. The soldiers are preparing for a scheduled deployment to Iraq.

high intensity and physically demanding combat environment.

Conclusion

Eerily reminiscent of the Vietnam era, we see indications that the army is at increasing risk of improperly training its soldiers because of the commitment of forces to Afghanistan and until recently Iraq. Many instructor positions have been “outsourced” to private contractors with only approximately 30% of those slots being filled by army personnel. This leads to a perception among the enlisted forces that something is amiss. This possibly affects morale when soldiers question why noncommissioned officers are not the instructors who provide their combat training.

There is one major change since the Vietnam era. Previously, soldiers were deployed to the combat zone on an individual basis. They had to adjust to new squad members, and they might not be at the same level of competency as each other. Today, soldiers who are deployed to Iraq and Afghanistan go as a unit. This provides for a greater degree of unit cohesiveness since these individuals trained together prior to overseas deployment and understand each other's strengths and weaknesses.

TRAINING, ARMY OFFICERS

The U.S. Army officer education system is designed to prepare officers for increasing levels of responsibility as they progress through their careers. In general, education for company-grade officers—lieutenants and captains—is focused on tactics and on the specific skills required for their branch. The education for majors is not branch specific and focuses on the employment of divisions and corps, while also training the majors to serve in staff positions in battalions and brigades. At the highest levels of officer education, the War College, select lieutenant colonels and colonels are educated on the strategic and political levels of war.

Early Officer Education

Until the late 19th century, the U.S. Army provided no formal education for officers after commissioning, following a common assumption that the ability to command came from experience and inherent characteristics. The United States Military Academy at West Point prepared new officers to assume the duties of a junior officer on graduation, with an emphasis on basic military skills, leadership, and personal integrity. While most army officers were graduates of West Point, others were commissioned from the enlisted ranks or directly from civilian life, sometimes with little formal education beyond high school. In 1862, the Morrill Act, which established the land-grant colleges, required that such colleges teach tactics, which was the beginning of the Reserve Officers Training Corps, although the system for using civilian colleges as a source for commissioned officers would not become formalized until the National Defense Act of 1916. In the years before the United States entered World War I, General Leonard Wood began a series of training camps, called Plattsburgh camps after the site of the first one in Plattsburgh, New York. Plattsburgh

camps acquainted educated civilians with the military and later became the model for officer candidate schools, which produced officers, especially during wartime when there was a need to rapidly expand the officer corps. The early years of an officer's career were essentially an apprenticeship during which time a junior officer would learn the skills to command a company under an experienced captain. While officers were encouraged to engage in self-study of the military profession, and some officers were able to earn advanced degrees at civilian colleges, for most officers formal education ended with commissioning.

Birth of Professional Military Education

After the American Civil War (1861–1865), the military began to address the need for formal military education for officers after commissioning. The change came, in part, from the recognition of the shortcomings of many officers who led the large Union army during the war and also from the influence of developments in Europe in providing formal education for midcareer officers. Schools such as the Prussian *Kriegsakademie* had become centers for educating senior company grade and field grade officers in a higher understanding of war. Under General William T. Sherman, the School of Application was founded at Fort Leavenworth, Kansas, in 1881, as one of the first formal schools for officers. The school at Fort Leavenworth was renamed as the Infantry and Cavalry School in 1886 and as the School of the Line in 1907. Selected graduates of the year-long course attended the General Staff School the following year.

The army created its War College in 1901 at Washington Barracks, D.C., to provide formal education to a select group of lieutenant colonels and colonels in solving strategic problems in war, partly from the recognition of the deficiencies in the strategic competence of the U.S. Army exposed by the Spanish-American War (1898). The War College closed during World War II but reopened in 1950 at Fort Leavenworth. It moved to its present location at Carlisle Barracks, Pennsylvania, the next year.

The Twentieth Century

The development of mass armies during the two World Wars, and the concurrent massive expansion of the officer corps, led to the formalization

of branch-specific training programs for new officers after commissioning. After completing a commissioning program, new lieutenants would spend anywhere from a few weeks to several months attending schools intended to make lieutenants more immediately useful in their first assignments, with further schooling ideally before taking company command. The branch schools were held at Fort Benning, Georgia; Fort Riley, Kansas; and Fort Sill, Oklahoma. After World War II, as a result of studies into the performance of company commanders in the war, the army began to reform its education of junior officers to better prepare officers for the challenges of command. Schooling for company grade officers was formalized into the Officer Basic Course (OBC), attended immediately after commissioning, and the Officer Advanced Course (OAC), to be attended between the 5th and 12th year of service. The branch-specific OAC, normally about 5 months in duration, would further hone officers' skills and prepare them for their duties as captain. Both courses were focused at the tactical level. OAC provided instruction in combined arms operations and the functions of a division's general staff. However, attendance at the advanced course was originally not required for company command.

The important role played by officers who had graduated from both the School of the Line and the General Staff School in preparing the mass army for World War I and in organizing the major operations it fought in France led the army to combine the two schools when they reopened in 1919. In 1923, it was renamed the Command and General Staff School. About half of the Regular Army officers were selected to attend the school in the interwar years.

The Modern Officer Education System

The basic pattern of officer education was in place by the end of the 1950s. During their careers, officers progressed through the Officer Basic Course, Officer Advanced Course, Command and General Staff Officers Course (CGSOC), and finally, the War College. While all officers attended their basic and advanced courses, only about half were allowed to attend the CGSOC in residence. Those who were not selected for the resident course usually had the option of taking it through the Total Army School System (TASS) or through distance education (DE). Courses held through TASS are conducted by the

Army Reserve and usually combine weekend training with 2-week-long resident phases. While the Command and General Staff College and the War College either closed for the duration of the World Wars or ran large, abbreviated versions of their courses, the schools have since remained open during wartime. In 1981, a new course, which the Combined Arms and Services Staff School quickly dubbed "CAS3" or "CAS cubed," was added after the Advanced Course. CAS3 was conducted by the Command and General Staff College, with the resident version lasting between 6 and 9 weeks, depending on the year taken. The purpose of the course was to equip officers to serve as staff officers at the battalion and brigade levels and also to force officers to function with officers from other branches.

After studies in the early 1990s, the army reorganized its precommissioning and basic courses into a series of phases dubbed the Basic Officer Leaders Course (BOLC). Initially, BOLC consisted of three phases, with the precommissioning education as BOLC I—United States Military Academy, Reserve Officers Training Corps, or Officer Candidate Schools. After commissioning, new second lieutenants attended a 6-week course in basic combat and leadership skills, BOLC II. After completing BOLC II, lieutenants attended a branch-specific OBC, BOLC III. OBC acquaints new officers with the specific skills needed to perform as platoon leaders in their assigned branch. The instruction is focused at the tactical level. BOLC II was eliminated in October 2009, and BOLC I and III were redesignated as BOLC Phases A and B. Following completion of OBC, most officers are assigned to line units and assume their leadership roles. Some will delay joining their new units to attend more specialized training, such as Ranger, Airborne, or Air Assault schools, which they attend alongside enlisted soldiers. While serving as lieutenants, some will be selected for further specialized training such as the Army Reconnaissance Course, Infantry Mortar Leaders Course, or Battalion Motor Officer Course. Before taking command of a company, or like-sized unit, many posts or divisions require officers to attend a precommand course, normally of 2 weeks or less, that acquaints future commanders with the details of running a company. In 2004, the Officers Advanced Courses were changed, and much of the material from CAS3 was merged into the Officers Advanced Courses to create the new Captains' Career Courses

(CCC). The separate CAS3 course was discontinued. In Captains' Career Courses, instruction is still geared to the tactical level of war, but it deals with the employment of battalions and brigades.

At the field grade level, officer education becomes focused on the operational and strategic levels of war and is not branch specific. In the early 2000s, the army revamped the CGSOC curriculum, although it remained focused on the division and corps levels. The newly restructured course was dubbed Intermediate Level Education (ILE). The course is divided into two halves—Common Core (ILE-CC) and the Advanced Warfighting Course (ILE-AWC). Admittance to the course had long been competitive, but beginning in 2003, most active army officers have been allowed to take at least the Common Core part of the instruction in residence, with Fort Leavenworth graduating about 1,500 officers per year. Officers from the Operations Support Career Field (OSCF), Information Operations Career Field (IOCF), and Institutional Support Career Field (ISCF) normally attend a 3-month version of ILE-CC at one of several satellite locations—Fort Belvoir or Fort Lee, Virginia; Fort Stewart, Georgia; or Redstone Arsenal, Alabama. Some board-selected Reserve Component and Special Branch officers also attend ILE-CC at the satellite locations. About 2,000 officers per year, mostly from the Army Reserve and Army National Guard, take the ILE-CC through DE or TASS. Officers who take the Common Core at one of the satellite locations, through DE or TASS, and about 20% of officers who take it in residence at Fort Leavenworth, must take the AWC portion through DE if they desire to complete the entire ILE program. Officers in more specialized branches outside Combat Arms complete a branch or functional area credentialing course, which takes the place of AWC. Students who attend the entire ILE course at Fort Leavenworth have the option of earning a Master of Military Arts and Sciences (MMAS) degree from the Command and General Staff College by completing and defending a thesis and taking oral examinations, or they can earn a master's degree while in ILE through programs offered by civilian universities. About 150 selected volunteer graduates of the ILE course are allowed to attend the Advanced Military Studies Program at the School of Advanced Military Studies, a 10-month MMAS granting program that is also under the Command and General Staff College. Graduates from School

of Advanced Military Studies are usually assigned to a planning staff at a division or higher level for their next assignment. The Command and General Staff College also administers several precommand courses lasting several weeks that are designed to further prepare officers to assume command of battalions or brigades.

The capstone of the officer education system is the War College, where officers take the Senior Developmental Education Course. About 350 students are selected by a board to attend the War College in residence, with another 150 positions in the DE version reserved for active army officers. About 50% of the eligible officers are allowed to attend the War College in one of its forms. At the War College, or at one of its peer programs at the National Defense University, sister services, or the senior-level course at the School of Advanced Military Studies, select lieutenant colonels and colonels become more familiar with war at the strategic level. The curriculum is focused on the Army, Major Command, and Joint/Theater levels. The army's War College consists of a 10-month-long course. Graduates earn a master of strategic studies degree from the War College. Officers can also receive credit for the War College by taking a 2-year version that combines DE with short resident phases.

Reserve Officer Education

For most officers in the Army Reserve or National Guard, as well as some active army officers, attendance at most resident courses is not an option due to budgetary constraints or the inability to take time off from civilian occupations. While all officers, whether active or reserve component, must take the same precommissioning and OBC courses, subsequent courses are available in modified form for reserve component officers. Most reserve component officers attend their Captains' Career Course through a five-phase program that lasts more than 2 years. Reserve component versions of the Captains' Career Courses normally consist of a combination of online training and 2-week-long resident phases. Likewise, ILE-CC is offered as a purely DE version or through TASS. Officers who take it through TASS take a three-phase program, with Phases I and III offered at consolidated regional training centers. Phase II is offered at smaller regional classes normally held one weekend a month. Students may combine taking

some phases through TASS with other phases taken through DE. AWC must be taken, if at all, through DE. Attendance at the War College remains selective, with selection boards for both the 10-month resident course and the 2-year DE version.

TRAINING, COAST GUARD ENLISTED

Training procedures are critical to a strong enlisted Coast Guard force, from basic training for recruits to ongoing training throughout each service member's career. The Coast Guard provides many training opportunities that enhance individuals' professional and trade skills while increasing the sea service's overall capability to perform its missions.

In 2010, the U.S. Coast Guard included approximately 36,000 active-duty enlisted personnel. Coast Guard ranks are from E-1 to E-9. Ranks E-1 to E-3 are referred to as seamen. Rank E-4 and above are called petty officers. Rank E-7 and above are called "chief" petty officers.

Coast Guard "boot camp" for newly enlisted active- and reserve-duty personnel occurs at the Coast Guard Training Center at Cape May, New Jersey. The 8-week course includes training in basic seamanship and other service-related skills, discipline, and physical training. Graduates of basic training are required to complete a series of physical tests, such as calisthenics and runs in a finite time period, treading water for 5 minutes, and completing a swim circuit. These tests are more strenuous than the U.S. Army's basic training requirements. For example, the army requires enlisted recruits to perform 31 push-ups in 2 minutes, while the Coast Guard requires 29 push-ups in one minute to graduate.

Additional skills training is provided at one of the service's 16 Class "A" schools. These are located at one of the Coast Guard training centers: Coast Guard Training Center, Petaluma, California; Coast Guard Training Center, Yorktown, Virginia; Coast Guard Maritime Law Enforcement Academy, Charleston, South Carolina, or Coast Guard Aviation Technical Training Center, Elizabeth City, North Carolina. Graduates of the school receive a "rating," qualifying them with a technical skill on a range of disciplines from Electronics Technician to Boatswain's Mate. A seaman must have a minimum of 30 months remaining on his or her enlistment to attend a Class A school.

There are many ratings that enlisted members can achieve that support the various elements of the Coast Guard's missions. These ratings fall under six groups:

Deck & Ordnance Group

- Maritime Enforcement Specialist
- Boatswain's Mate
- Gunner's Mate
- Operations Specialist
- Intelligence Specialist

Hull and Engineering Group

- Damage Controlman
- Electrician's Mate

- Electronics Technician
- Information System Technician
- Machinery Technician

Aviation Group

- Avionics Electrical Technician
- Aviation Maintenance Technician
- Aviation Survival Technician

Administrative and Scientific Group

- Food Service Specialist
- Health Services Technician
- Marine Science Technician
- Public Affairs Specialist
- Storekeeper
- Yeoman

Reserve Only Group

- Port Security
- Investigator

Enlisted Professional Military Education Group

- PME Rating Knowledge Manager

Coast Guard enlisted personnel can also receive a rating through the Striker Program. This involves a combination of on-the-job training and self-study rather than conventional education conducted in a classroom. A seaman can qualify for five different ratings under this program: Boatswain's Mate, Damage Controlman, Food Service Specialist, Machinery Technician, and Storekeeper.

Class "C" schools provide advance training and specialized skills for enlisted personnel. Class C schools include training and education provided by the Coast Guard as well as the other military services, the Department of Defense, and other government agencies.

The Coast Guard also allocates AFC30-T funds for training not offered by service Class A or C schools. These funds are available for training for both active and reserve personnel. They are made available to cover training requirements for duties in three categories. Category 1 training includes that which must comply not only with federal law but also laws at the state and local levels where applicable. An example of this is that Lead Building

Inspector Training is mandated by federal law and through Asbestos, Lead and Radon in Coast Guard housing regulations, the training for which is not provided in A or C class schools.

Category 2, job critical/mission essential training is set by order of the commandant of the Coast Guard. An example is the requirement for Damage Controlmen at Integrated Support Command Portsmouth to be skilled in welding, which they can obtain at a community college (<http://www.uscg.mil/hq/CGI/>).

Category 3 is professional development related to a service member's current assignment or that which will provide essential enhancement in an individual's skills or abilities. An example of Category 3 training is Basic/Advanced Locksmith training.

Boat Forces Command Cadre School prepares chief petty officers and senior petty officers for leadership and command assignments, including Executive Petty Officer or Engineering Petty Officer billets, at small operating units.

In the course of their careers, enlisted personnel may participate in a number, and wide variety, of professional development training and education opportunities, including Marine Safety Industry Training and Port Safety/Security Industry Training.

In addition, active- and reserve-duty officers can take free online courses on the U.S. Coast Guard Learning Portal.

Enlisted personnel with at least 8 years of military service can apply for Warrant Officer training. Training for warrant officers occurs at the Coast Guard Chief Petty Officer Academy. The Academy is in New London, Connecticut. The Chief Warrant Officer Professional Development Course provides courses for transition into the officer corps.

TRAINING, COAST GUARD OFFICERS

Coast Guard officer training primarily takes place at the U.S. Coast Guard Academy, although there are a number of other avenues by which college-educated recruits can train to become commissioned officers. Around 75% of academy graduates earn technical degrees in various areas of study, such as engineering, sciences, or mathematics. The academy's mission statement is as follows:

The United States Coast Guard Academy is committed to strengthening the nation's future by educating, developing, training, and inspiring leaders of character who are ethically, intellectually, professionally, and physically prepared to serve their country and humanity, and who are strong in their resolve to build on the long military and maritime heritage and proud accomplishments of the United States Coast Guard.

In 2010, there were more than 8,000 active-duty officers in the U.S. Coast Guard. This number included both commissioned and warrant officers. They constitute about 20% of the active-duty force. Commissioned officers ranks are from 0-1 (ensign) to 0-10 (admiral). Warrant officers rank range from chief warrant officer 2 to chief warrant officer 4. The Coast Guard has established professional education and training for both ranks.

Commissioned officer education and training begins with precommissioning that includes both academic classes and military training. The primary source of precommissioning education is the U.S. Coast Guard Academy at New London, Connecticut. The academy, with a student body of more than 900, offers a 4-year undergraduate education and bachelor's degree. In 2010, *US News and World Report* ranked the academy as the Number 1 college under the category of "Regional Colleges, North." Incoming cadets must participate in "Swab Summer," a 7-week military training program. This program includes physical fitness training and general military skill building, with emphases on seamanship, swimming, and academics. During the year, the cadet regimen includes military training, academic classes, and athletics. Cadets also undertake a 10- to 14-day "long cruise" on a U.S. Coast Guard cutter. Graduates are commissioned as

ensigns. The academy commissions about 40% of the service's officer corps.

Specific areas of study at the academy include naval architecture and engineering, professional maritime studies, strategic intelligence studies, and mathematics. Course work such as ship and maritime systems knowledge and fundamentals of navigation are found in the professional maritime studies program, for example.

The Coast Guard does not participate in the Reserve Officers' Training Corps (ROTC), which provides scholarships for precommissioning training at civilian universities. However, the Coast Guard's Officer Candidate School (OCS), also in New London, offers college graduates 17 weeks of training in various areas, including nautical science, law enforcement, seamanship, and leadership. Graduates are also commissioned as ensigns. College sophomores and juniors can compete for the College Student Pre-Commissioning Initiative program, which offers scholarships and training in preparation for participation in OCS.

The U.S. Coast Guard does participate in the Junior Officer Training Corps, a federally funded program that provides leadership training to high school students.

Some professionals, such as lawyers, aviators, engineers, graduates of the U.S. Maritime Academy, or former military officers of the army, navy, marines, and air force can apply for Direct Commissioning Programs, a 3- to 5-week precommissioning course.

Commissioning training for reserve officer candidates is done through the Selected Reserve Direct Commission Program, which includes 3-week courses held each summer at the Coast Guard Academy. Reserve officer programs include studies in law, engineering, intelligence, marine safety, computer and information technologies, and reserve program management.

Training for warrant officers occurs at the Coast Guard Chief Petty Officer Academy. This academy is also in New London. The Chief Warrant Officer Professional Development Course provides courses for transition into the officer corps.

Boat Forces Command Cadre School prepares junior officers as commanding officer, executive officer, or officer in charge for assignments in small operating units.

The College Student Pre-Commissioning Initiative is a scholarship program for college juniors and seniors that pays for their tuition and prepares

them for OCS. While continuing their normal course of study, students awarded this scholarship must complete Coast Guard basic training, adhere to the Coast Guard Code of Conduct, and perform Coast Guard duties. The Wilks Flight Initiative is a program for Coast Guard seniors of the College Student Pre-Commissioning Initiative seeking to become Coast Guard aviators. Acceptance into this program guarantees students acceptance into flight training school on completion of OCS.

In the course of their careers, Coast Guard officers may participate in a wide variety of professional development training and education opportunities, such as Marine Safety Industry Training and Port Safety/Security Industry Training. The Coast Guard also offers opportunities for officers seeking postgraduate and advanced education degrees. Eligible officers may submit résumés so that they can be considered for an advanced degree based on their professional experience within the Coast Guard. Examples include a law degree, a master's of business administration, marine safety industry training (port safety and security, merchant marine, etc.), and degrees leading to academy instructor (in fields of physical sciences, such as chemistry, or humanities, such as literature or history). More technically advanced degrees are attainable through this system as well, such as a master of science in acquisition project management, advanced computer and electronics technology programs, and a master of science in marine engineering. In addition, active- and reserve-duty officers can take free online courses on the U.S. Coast Guard Learning Portal.

Senior military education occurs through attendance or nonresident participation at the Pentagon's Senior Service Schools, including the Service War Colleges, the National War College, and the Industrial College of the Armed Forces, or participation in fellowship programs, such as the RAND Military Fellowship. Some of the schools award a master's degree.

TRAINING, MARINE CORPS ENLISTED

The U.S. Marine Corps portrays an image of being an elite fighting organization able to project American power abroad and implement national policy. To do this, the Marine Corps relies predominantly on enlisted marines. It has the lowest officer-to-enlisted ratio within the Department of Defense. Enlisted marines and enlisted noncommissioned officers (NCOs) are called to perform tasks that, in other services, normally would be carried out by commissioned officers. The Marine Corps was designated by Congress as a “force in readiness,” able to respond at once to support a naval campaign or to suppress international disturbances. Launching from sea-based platforms called Marine Expeditionary Units, marines are required to be flexible and adapt quickly to hostile and nonhostile environments in order to accomplish missions ranging from humanitarian relief to conventional war.

Since there is such a reliance on enlisted marines, their training and education is paramount to the success of the Marine Corps. Emphasizing discipline, leadership, and an adherence to a code of conduct that is considered Spartan, the corps is able to create a professional enlisted warrior. Beginning with an indoctrination program at Basic Training, continuing with a mixture of Marine Corps and Department of Defense operated military occupation specialty schools, and advancing with a combination of a corps-wide school system and unit-training programs, the Marine Corps has been able to consistently produce highly qualified warfighters. This

training progression is the result of more than 200 years of institutional experimentation, critical study, and trial and error. It is this Marine Corps system of training that this entry is directed at.

Recruit Training

The initial training for enlisted marines is designed to separate recruits from their civilian selves and to remold them into a warrior elite that is ethically and morally pure. This is done in the hope that the marine who emerges from recruit training will have a foundation on which sophisticated 21st-century warfighting skills can be built. Marine Corps Recruit Training, or boot camp, is an indoctrination program that all enlisted marines, both active-duty and reserve, must endure. Unlike other services, the Marine Corps does not separate their recruits by military occupation specialties (MOS) for basic training. By not doing this, the corps is able to maintain a culture that is not unique to any individual unit, training facility, or MOS. Boot camp is the common thread that binds all and is responsible for the formation of a collective identity that is embraced by both past and present enlisted Marines.

Currently, there are two recruit training depots in the Marine Corps. The first and most well-known is Parris Island, South Carolina. Situated on 8,095 acres of land, most of which are salt marsh, Parris Island was officially named a Marine Corps Recruit Depot in November 1915. Opened to create a central training facility for the corps, Parris Island was still in the process of being built when the United States entered World War I. On President Woodrow Wilson's mobilization of the armed services, the Marine Corps sent thousands of recruits to the depot for basic training. During the war, training consisted of a mixture of marksmanship, weapons familiarization, close-order drill, and manual labor. The recruits themselves built many of the buildings. As a link to tradition, recruits are still mandated to support the base and its operations. There is an entire week written into the training schedule dedicated to depot maintenance.

Recruit training did not take place exclusively at Parris Island during the First World War. Due to the massive influx of manpower, smaller recruit training bases were established. After the war, most were dismantled. One that remained was a base situated in San Diego, California. Here, the marines remained, and the base became a major

recruiting center. With the outbreak of World War II, the base was again tasked with the training of recruits. It was not until 1948, however, that the base was officially designated Marine Corps Recruit Depot (MCRD), San Diego. Currently, the Marine Corps sends all of its male recruits who enlisted west of the Mississippi River to MCRD San Diego, while MCRD Parris Island trains the male recruits who enlisted east of the Mississippi River, as well as all female recruits.

Recruit training for the Marine Corps is constantly being revised and updated to increase its effectiveness. The current training regimen is 12 weeks long, is separated into three phases, and culminates in a final exercise known as the Crucible. Recruits are taught military subjects such as rank structure, the organization of the Marine Corps, uniform regulations, grooming standards, and the Uniform Code of Military Justice. Close-order drill and the manual of arms are ever present, and recruit platoons are graded based on their performance in these areas. The corps believes in stressing close-order drill and the manual of arms because they teach self-discipline, teamwork, and instant obedience to orders. Marksmanship training is one of the most important aspects of boot camp. Traditionally, marines are supposed to be expert marksmen, and recruit training embraces this history. Surprisingly, there are little, if any, combat skills taught at the recruit depots. Instead, the Marine Corps teaches these skills immediately after recruit training and prefers to concentrate only on indoctrinating recruits into the culture and ethos of being a U.S. Marine.

School of Infantry

Newly titled marines are sent to the School of Infantry (SOI). Located on both coasts, SOI East at Camp Lejeune and SOI West at Camp Pendleton, it is here that marines are trained in the tactics, techniques, and procedures required of them in combat. Since the Marine Corps is an infantry-centric fighting force, it propounds the motto "Every Marine is a Rifleman," meaning all marines, regardless of MOS, are supposed to be able to pick up a rifle and effectively engage the enemy. For noninfantry marines, this requires their attendance at the Marine Combat Training course. During the 29-day course, marines are given a program of instruction designed

U.S. Marine Corps recruits assigned to the 1st Recruit Training Battalion, Charlie Company, and the 4th Recruit Training Battalion, Oscar Company, perform the maneuver under fire portion of the day movement course during basic training at Paige Field in Marine Corps Recruit Depot, Parris Island, South Carolina, February 16, 2010. Maneuver under fire comprises the low crawl, high crawl, back crawl, and sprinting.

Source: U.S. Marine Corps photo by Lance Corporal Vernon T. Meekins.

to thoroughly familiarize them with the basics of infantry combat. Their training includes the firing of most man-portable infantry weapons; the practicing of small unit offensive, defensive, and patrolling tactics; and, since the wars in Iraq and Afghanistan, an introduction to convoy security operations. On completion of Marine Combat Training, noninfantry marines proceed to their MOS school.

Infantry Marines at SOI are sent to Infantry Training Battalion where they are thoroughly trained in the individual techniques required of being an infantryman as well as introduced to the fundamentals of small unit tactics, techniques, and procedures. Since this is their MOS school, infantry marines spend 59 training days in the Infantry Training Battalion. The infantry is the heart and soul of the corps, and the high quality of training that

these young marines receive is essential to their effectiveness when they go to their Fleet Marine Force (FMF) units.

Military Occupation Specialty Schools

After Marine Combat Training, noninfantry marines proceed to their primary MOS schools. There are very few noninfantry MOS schools within the Marine Corps. Most noninfantry marines attend MOS schools run by the other services, or by joint commands. For instance, marines designated as artillerymen go to the U.S. Army's Artillery School at Fort Sill, Oklahoma. Marine Tankers attend the Armor School at Fort Knox, Kentucky. Public Affairs marines are sent to the Department of Defense's Defense Information School at Fort

U.S. Marine Corps Staff Sergeant Joseph L. Boehm (standing) and Staff Sergeant Charles W. Rogall, marine students attending the Infantry Unit Leaders Course, Advanced Infantry Training Battalion, School of Infantry-East, call for the medical evacuation of a simulated casualty during urban combat training on Camp Lejuene, North Carolina, March 16, 2011.

Source: U.S. Marine Corps photo by Lance Corporal Maxton G. Musselman.

Meade, Maryland. There, clustered together in detachments of marines, they go through the same instruction as everyone else. Marine instructors are present at these schools and are responsible for most, if not all, of the marines' practical application exercises.

On initial inspection, the Marine Corps's use of other services' schools may appear to be in reaction to the Goldwater-Nichols Defense Reorganization Act of 1986, which forced the streamlining and integration of the services' training and education

programs. This, however, is not the reason why the Marine Corps sends marines to these schools. There is a long historical precedence for the Marine Corps's use of the other services' schools. Begun on a massive scale during World War I, the Marine Corps sent hundreds of marines to various army and navy schools. This practice continued in the interwar years but decreased substantially during World War II. During World War I, the corps did not have the manpower or the facilities both to establish schools and send marines to fight in France. This was not the case when World War II started. The corps's planners immediately recognized the need to greatly expand the corps's school system because the army and navy were overwhelmed by the huge influx of conscripted servicemen. After World War II, with the demobilization of the military, the Marine Corps shut down many of its more specialized schools and opted to maintain more marines in the operating forces by sending them to the other services' schools.

Unit Training

Once marines are finished with recruit training, SOI, and their MOS schools, they are sent to units throughout the Marine Corps. For most, they are sent to the FME, which is the operations arm of the corps. Ordered to man billets in units throughout the FME, marines begin on-the-job training. On-the-job training is an integral part of the process of creating a 21st-century warfighter, and it is here that the constant guidance and supervision of NCOs is crucial. In noninfantry units, the units are responsible not only for performing their primary MOS duties but also for maintaining proficiency in basic infantry skills.

For infantry marines, training for combat is their sole purpose for existence, and everything they do revolves around learning to be effective in combat. Unlike the U.S. Army where operating with larger units is more prevalent, the largest unit that the Marine Corps trains with is a reinforced infantry battalion. Unit training consists of ranges, field exercises, conditioning hikes, and classes taught by corporals and sergeants, who are considered NCOs in the Marine Corps. NCOs learn how to lead marines, perform their duties and responsibilities, and take care of their marines through on-the-job training. At times, corporals and sergeants are sent to various NCO leadership courses. For the most

part, NCO-specific training in the Marine Corps is either nonexistent or is not relevant for infantry marines despite the corps's recent efforts to change this. Therefore, the preparation for becoming an NCO is largely completed by learning through experience when conducting unit training and by being mentored by senior NCOs.

Enlisted Schools

The Marine Corps maintains various supplemental MOS schools as well as other smaller-scale combat skills courses. These schools are designed to train a cadre of instructors who then take what they learned and teach it to other marines during unit training exercises. Run by various commands, these courses of instruction fall under the direction of Training and Education Command (TECOM), Marine divisions, regiments, and, at times, individual battalions. Recently, the Marine Corps tried to consolidate training under the Training and Education Command, but there are still some schools outside the Training and Education Command's direct supervision.

Many of these courses are run through SOI under the Advanced Infantry Training Battalion.

Conclusion

One of the dominant misperceptions of enlisted marines held by the public is that marines are automatons instantly responding to orders without thought or emotion. This is not the case and is contradictory to Marine Corps doctrine, which requires subordinates to challenge their leaders until a decision is made. All of the enlisted marines' training is designed to instill confidence, encourage initiative, and inspire courage. The 21st-century warrior must be intelligent, thoughtful, and decisive. Marine Corps training seeks to cultivate these qualities within its enlisted marines.

TRAINING, MARINE CORPS OFFICERS

Tracing the professionalization process of the officer corps sheds light on the effectiveness and efficiency of the U.S. Marine Corps. A highly educated, trained, and experienced officer corps generally signifies an effective and efficient military force. Since the occupational objective of a military is to wage war for national interests, many military professionals go through their entire career without participating in the real-life version of their profession. The opportunity for an officer to engage in warfare is minimal; therefore, examining the training of officers is necessary to assess the Marine Corps's potency as an instrument of national policy.

The Marine Corps has a multifaceted officer training program. Introductory training is conducted at Officer Candidates School (OCS) and The Basic School (TBS). Both schools are physically and mentally challenging and are designed to select officers rather than train officers. After TBS, marine officers attend a military occupation specialty school run by the Marine Corps, another service, or the Department of Defense. Following this, officers are assigned to units throughout the Corps. Most officers do not attend Marine Corps established supplemental military occupation specialty schools and combat skills courses because enlisted marines fill the majority of these programs' quotas. Unit training is the primary means for officers to gain experience beyond the classroom. Throughout officers' careers, they are required to enter into professional military education programs that advance their understanding of the complexities of 21st-century warfare.

Officer Candidates School

Drawing from a vast array of sources, the Marine Corps procures officers in much the same way as the other services. The vast majority of marine officers enter the Marine Corps directly from college. Some, on graduation from the Naval Academy, select the Marine Corps to fulfill their obligatory service. In very few instances, West Point graduates choose the Marine Corps. The remaining officers are selected from the ranks of enlisted marines. According to the Marine Corps, the percentage of candidates entering each class comes from the following commissioning pathways: 35% from the platoon leaders' course, 24% from the officer candidate course, 16% from the Naval Reserve Officers Training Corps, 15% from the United States Naval Academy, and 10% from the enlisted commissioning programs. The percentage of candidates who attended colleges other than military academies is 75%. Therefore, the composition of the marine officer corps is predominantly filled with graduates from civilian universities. This is the highest percentage among all the services. In keeping with the corps's reliance on enlisted marines, of all the services, the Marine Corps has the highest percentage of enlisted personnel advancing to the officer ranks.

Located only at Marine Corps Base Quantico, Virginia, OCS is designed to select marine officers instead of train them. This is in stark contrast to marine recruit training where drill instructors attempt to break down individuals and rebuild them as marines. At OCS, the instructors are there to guide the candidates into becoming Marine Corps officers. The motivation, physical stamina, and leadership skills needed to graduate must come from within each candidate. The washout rate for some OCS classes is 30%. Most OCS drops are due to physical injury, but there are instances where candidates drop on request. Review boards are convened periodically to evaluate candidates who are not performing to the corps's standards. These review boards consist of the instructors and marine officers who carefully examine the candidate's scores, appearance, physical performance, and overall desire to become a Marine Corps officer. The official evaluation guidelines for OCS are the following: 50% leadership, 25% academics, and 25% physical fitness. If the candidates are deemed unfit, they are dismissed and dropped from the course.

The three core areas of leadership, academics, and physical fitness are reflected in the training

U.S. Marine Corps officer candidates with Delta Company perform the fire and maneuver portion of the combat readiness test at Officer Candidates School at Marine Corps Base Quantico, Virginia, March 6, 2009. Officer Candidates School trains, screens, and evaluates officer candidates to ensure that they possess the moral, intellectual, and physical attributes for commissioning.

schedule for OCS. The candidates' leadership qualities are tested continuously by formal examinations based on classroom instruction, performance when placed in various class leadership billets, and willingness and effectiveness in helping classmates and through several leadership reaction courses. The foundation for the academic evaluation is general military subjects. These include the Uniform Code of Military Justice, Marine Corps history, infantry tactics, land navigation, organization of the Marine Corps, and other pertinent information concerning

the corps. Perhaps the most demanding gradable quality, physical fitness, is measured through a series of events that require the candidates to be placed in high-stress environments. Candidates must maintain a high degree of professionalism and emerge from these events as established leaders. Physical conditioning exercises include obstacle courses, confidence courses, combat fitness tests, and the Marine Corps Martial Arts Program. After successful completion of the 10-week training schedule, candidates graduate and immediately enter TBS located just down the road at Marine Corps Base Quantico.

The Basic School

TBS is where all commissioned second lieutenants in the Marine Corps are ordered after OCS. TBS is a 26-week program designed to teach marine officers the fundamentals of infantry combat. Similar to the enlisted marines' recruit training, OCS does not teach officers much about battle tactics. TBS's mission is to produce basically trained infantry platoon commanders for service in the Fleet Marine Force (FMF). This does not mean that every marine officer is an infantry officer. It does mean, however, that all marine officers are expected to lead marines in combat. The Marine Corps is a light infantry-oriented expeditionary fighting force and, as its history demonstrates, requires that all marines be riflemen regardless of their military occupation specialty. Marine officers, in turn, must be trained to lead these marines.

TBS is divided into four phases of instruction where second lieutenants are trained in individual combat techniques, rifle squad tactics, rifle platoon tactics, and basic tactics needed for officers performing missions within the Marine Air Ground Task Force (MAGTF). The training schedule is packed with a mixture of classroom instruction and practical application exercises. TBS contains several field exercises where the second lieutenants are placed in different infantry leadership billets and graded based on their performance as an effective leader. These field exercises mimic the progression of instruction in that they are focused on developing individual, fireteam, squad, platoon, and platoon-reinforced infantry tactics, techniques, and procedures. Both enlisted marine combat instructors and marine officer instructors grade all exercises and field problems.

TBS is designed to create a common culture among Marine Corps officers. That culture is one that places

the infantry first and all other functions that Marine Corps officers perform second. The Marine Corps believes that by requiring all newly commissioned second lieutenants to experience the hardships of infantry officers and be thoroughly trained in infantry tactics, techniques, and procedures, the noninfantry officers will be in a better position to support the infantry. In the Marine Corps, all noninfantry marines exist solely to support the infantry. This is taught repeatedly to both enlisted marines and officers. On graduation from the infantry-centric TBS, the second lieutenants attend their military occupation specialty (MOS) school.

Military Occupation Specialty School

Similar to the enlisted marines' MOS training, many of the officers' MOS schools are located outside the command of the corps. They attend U.S. Army schools like the Artillery School at Fort Sill, Oklahoma, and the Armor School at Fort Knox, Kentucky. They are also sent to various Department of Defense operated schools, such as the Defense Information School at Fort Meade, Maryland.

Recognizing the institutional differences in warfighting, the corps retains and strictly manages the curriculums of the most crucial schools. Since the Marine Corps is an infantry-centric force that fights differently than its U.S. Army infantry counterpart, it sends infantry officers to the Infantry Officer Course situated next to TBS at Marine Corps Base Quantico. Using the same logic, the corps sends ground intelligence officers to Infantry Officers Course, Scout Sniper Platoon Commander Course, and Ground Intelligence Officer Course. The melding together of infantry and intelligence MOSs is essential for the Marine Corps to execute its mission while using its military intelligence-driven ground combat warfighting philosophy. On graduation from their MOS school, the second lieutenants are mostly sent to the FMF, which is the operational arm of the Marine Corps.

Unit Training

Checking into their FMF units, officers are expected to immediately take charge of their respective organizations. Noninfantry officers oversee communications, administration, logistics, supply, and many other essential infantry supporting units. In addition

to the everyday tasks of efficiently running their “shop,” as it is called in the Marine Corps, noninfantry officers must maintain the proficiency of their enlisted marines in basic combat techniques.

For infantry officers, taking charge of a platoon is what occurs on check-in. From the beginning, they are required to lead enlisted marines who, most likely, have been to combat two or three times already. New infantry officers rely heavily on their platoon sergeants and squad leaders to directly control the enlisted marines and guide their understanding of the realities of ground combat. It is the platoon sergeant’s job to make sure that his platoon commander is always seen as a near-perfect leader of marines. As a consequence, platoon commanders and platoon sergeants are nearly inseparable. Frequent informal consultations and training by the platoon sergeant occur, but always the platoon commander is in charge of the platoon. An infantry marine never questions orders from the platoon commander when they are issued.

Training in FMF units is continuous. Field exercises, sand table problems, and various training evolutions without troops are the primary means of an infantry officer’s training. At times, FMF units allow Marine Corps supplemental MOS schools and combat skills courses to be filled by marine officers. This, however, is rare because these schools are designed to provide FMF units with instructors. When these students graduate, they are expected to return to their units and teach their fellow marines. Noncommissioned officers, not commissioned officers, are troop handlers and instructors

Conclusion

The training of the corps’s officers has improved exponentially since the invasion of Iraq in 2003. Most marine officers completed at least one, most likely two, combat tours in either Iraq or Afghanistan. They experienced combat in urban, suburban, desert, and mountainous terrains. They participated in the full spectrum of 21st-century warfare by conducting combat, counterinsurgency, and humanitarian operations. The Marine Corps took the lessons learned from those combat deployments and integrated them into the training of marine officers. The quality of marine officers, in turn, has significantly increased.

TRAINING, MULTINATIONAL

Training conducted by the military forces of two or more nations is termed *multinational training*. The military branches that form the U.S. Department of Defense routinely participate in periodic training with the armed forces of other nations. This training promotes each nation’s collective, as well as individual, security interests against real and anticipated threats throughout the world. Each training event tests, analyzes, and evaluates each participating nation’s contingency planning, response effectiveness, logistical planning, and cooperative defense agreements pertaining to offensive and defensive operations. This entry provides an examination of multinational training and operations that military forces of the United States participated in during World War I (1917–1918), World War II (1941–1945), the Cold War (1945–1989), the post-Cold War period (1990–2001), Afghanistan (2001–present), and Operation Iraqi Freedom (2003–2011) and also examines the mechanics of contemporary multinational training conducted today.

World War I

With the entry of the United States into World War I on April 6, 1917, multinational training began in earnest for the first time. On his arrival in France in

June 1917, General John J. “Black Jack” Pershing, commander of the Allied Expeditionary Force (AEF), began a thorough review of the tactics and training methods used by the Allied armies to train their military forces. Great Britain and France had long maintained military training centers and professional schools to train their respective military organizations. Pershing seized on this idea quickly and began creating his own training centers for the arriving AEF. Recommendations were made to the War Department that combat-experienced officers from Great Britain and France be obtained and sent to the United States to assist in the training of recruits, noncommissioned officers, and commissioned officers for the AEF. While the locations and staffing requirements were being completed for the new AEF schools, Pershing made arrangements for current AEF noncommissioned and commissioned officers to attend military schools that were operated by Great Britain and France. Pershing and his staff faced many challenges in the process of how best to integrate the AEF into the well-established military hierarchy of the British and French military forces. Britain and France had been at war with Germany and its allies for more than 3 years by the time the AEF arrived in Europe. As a result, the British and French leadership pressed for the attachment of the fresh U.S. forces directly to their own forces to bolster their depleted ranks, a move that Pershing vehemently opposed. Pershing was a firm believer in having a single, supreme commander in charge of the coalition forces, instead of a multilevel council made up of officers from each of the nations.

World War II

During World War II, strategic thinking concentrated around the idea that Germany posed a greater risk than Japan and resulted in the United States participating in many multinational training exercises in the European Theater of Operations with allies Great Britain and France. The training primarily concentrated on preparations for Operation Torch, the invasion of North Africa in November 1942, and Operation Overlord, the cross-channel invasion of France that occurred on June 6, 1944. With the defeat of Nazi Germany as the primary goal, the next move for the Allies would be to build on the limited successes achieved in the Mediterranean in 1942. The selection of a supreme commander to

lead a cross-channel invasion of France had been decided on at the Casablanca Conference in 1943. General Dwight D. Eisenhower would ultimately be selected as the supreme commander of the expeditionary forces, but not before much political maneuvering by other well-known and qualified Allied senior officers.

Operation Jedburgh was the first clandestine multinational effort between the British Special Operations Executive, the U.S. Office of Strategic Services, the Free French Bureau Central de Renseignements et d'Action, and the Dutch and Belgian armies. Known as “Jeds,” these multinational teams trained for 2 to 4 weeks near Jedburgh, in the Scottish Borders, and then were parachuted into occupied France over the months leading up to the Normandy landings. In 1945, the “Jeds” operated against the Japanese forces in French Indochina and other occupied Southeast Asia nations and islands. British, American, Canadian, and Free French forces trained together in the months prior to Operation Overlord in June 1944. The best-known exercise, codenamed Operation Tiger, resulted in the deaths of more than 700 U.S. servicemen after they came under attack by German E-boats patrolling in the English Channel.

Cold War Period (1945–1989)

Europe

With the establishment of the North Atlantic Treaty Organization (NATO) in 1949, the need for multinational training in Europe became a priority. In 1958, the U.S. Army activated the 7th Army Training Center at Vilseck, Germany, near the Grafenwoehr Training Area, with the purpose of training American military forces for a potential invasion by the Soviet Union and its Warsaw Pact allies. Established in 1910, Grafenwoehr had served as a military training center for various Bavarian and German armies up until its capture during the closing months of World War II. However, no military training was conducted in the area between the years 1945 and 1958. Beginning in 1969, the annual multinational training exercise codenamed Operation REFORGER (REturn of FORces to GERmany) began to be held and quickly gained worldwide attention. NATO member nations sent their respective military organizations to Grafenwoehr to train alongside their U.S. counterparts and take a more

active part in the exercise. In 1976, the training center was renamed the 7th Army Training Command and given the expanded mission of providing and monitoring all training conducted by the U.S. Army Europe. Established at Hohenfels, Germany, in 1988, the Combat Maneuver Training Center developed and provided realistic combined arms training for the U.S. Army Europe, and the 7th Army's maneuver battalion task forces in force-on-force exercises. The center primarily focused its training on an expected NATO-Warsaw Pact confrontation and hosted military forces from West Germany, Great Britain, Canada, and France.

Korean War

After military forces from the Democratic People's Republic of Korea (North Korea) invaded the Republic of Korea (South Korea) in 1950, the fledgling United Nations scrambled to put together a coalition to resist the aggression. This coalition would eventually be centered on the post-World War II forces of the United States that were currently stationed in Japan. Over the next 3 years, military forces from Australia, Belgium, Canada, Colombia, Ethiopia, France, Greece, Luxemburg, the Netherlands, New Zealand, Philippines, South Africa, Thailand, and Turkey participated in resisting the military forces from North Korea and the People's Republic of China. Hostilities ended in 1953 after the signing of an armistice and the establishment of the Korean Demilitarized Zone. U.S. forces have routinely trained with their South Korean army counterparts in exercises on the Korean Peninsula since the end of the Korean War.

1989 to Post-9/11

Persian Gulf War

Multinational training took a new turn in importance with the invasion of Kuwait by the military forces of the Republic of Iraq on August 2, 1990. On August 7, 1990, under the operational code name "Desert Shield," President George H. W. Bush ordered naval, ground, and air forces of the United States to Saudi Arabia for defensive operations, as well as for offensive operations if needed. Within 48 hours, aircraft and ground units began to arrive. Supplies that had been prepositioned for just such an operation were sent to the region. Within 14 days, the first armored units began to arrive, bringing with

them the new M1A1 Abrams main battle tank. By January 1991, more than 695,000 troops, 1,650 aircraft, and 174 warships from Argentina, Australia, Bahrain, Bangladesh, Belgium, Canada, Denmark, Egypt, France, Greece, Italy, Kuwait, Morocco, the Netherlands, New Zealand, Niger, Norway, Oman, Pakistan, Portugal, Qatar, South Korea, Saudi Arabia, Senegal, Sierra Leone, Singapore, Spain, Syria, the United Arab Emirates, the United Kingdom, and the United States itself were positioned in the Kuwait Theater of Operations. During the military buildup, coalition forces received extensive desert military training from coalition members who were from the Middle Eastern region because many of the troops were unfamiliar with waging war in a desert environment. General H. Norman Schwarzkopf and his commanders knew that operating in a desert environment presented challenges for both the military equipment and, more important, for the troops themselves. Schwarzkopf also knew that during the Iran-Iraq War, Saddam Hussein had ordered the use of chemical agents against Iranian military forces and stressed this point to his commanders. Among the troops sent in support of the coalition were chemical warfare specialists from the Czech Republic who were familiar with the chemical weapons that Iraq had obtained from Warsaw Pact members and could possibly deploy during the conflict. Operation Desert Shield became Operation Desert Storm in January 1991 with massive coalition airstrikes being made on Iraqi defensive positions along the Kuwait-Saudi border and around major Iraqi cities. A few weeks later, after months of training together in the Saudi desert, coalition forces began the ground campaign to liberate Kuwait. Coalition forces continued to stay in the region beyond the official end of the conflict in April 1991 primarily due to the fact that Iraq still maintained a large military force despite the destruction of its forces in Kuwait.

Operation Enduring Freedom

The terrorist attacks on the United States on September 11, 2001, triggered an immediate multinational response beginning with NATO enacting Article 5 of its charter by declaring that the attacks on the United States were also an attack on all NATO members. John Howard, prime minister of Australia, quickly utilized the provisions of the Australia, New Zealand, and United States Security Treaty

(ANZUS) to provide assistance. President George W. Bush then ordered air, ground, and naval forces from the United States to begin military operations in Afghanistan under the operational code name “Enduring Freedom.” In October 2001, U.S. forces attacked Afghanistan in an effort to capture members of the terrorist organization known as al Qaeda and its leader Osama bin Laden, as well as to free Afghanistan from Taliban control. Joined by military forces from the United Kingdom and a group of ethnic tribes known as the “Afghan Northern Alliance,” U.S. forces quickly secured strategic airports and major cities, including Afghanistan’s capital, Kabul. The Taliban regime quickly folded and fled into the rugged mountain regions famous for their impenetrability. In 2002, military operations shifted toward counterinsurgency operations against remaining Taliban strongholds as the provisional Afghan Transitional Authority assumed governmental duties in Kabul.

Realizing that in order for the new government in Afghanistan to survive its military force would have to be completely rebuilt, in 2002 the United States began the arduous task of building a new Afghan National Army (ANA) with the creation of the Office of Military Cooperation, Afghanistan. Assisted by military personnel from Bulgaria, Canada, France, Germany, New Zealand, Romania, the United Kingdom, and Mongolia, the initial training for the ANA occurred at the Kabul Military Training Center and at a former Soviet military base outside the town of Pol-e-Charki. Established by UN Security Council Resolution 1386 in 2001, the International Security Assistance Force (ISAF) secured the Afghanistan capital of Kabul and its surrounding areas and would eventually be tasked with the overall responsibility for military operations in August 2003. U.S. reserve forces that had been originally mobilized for use in Iraq were diverted to Afghanistan to supplement ISAF and Special Operations Forces. ISAF continues to lead the multinational effort to train and equip the ANA, although major concerns remain about the financing and leadership of the ANA.

Operation Iraqi Freedom

In April 2003, a multinational coalition consisting of military forces from Australia, Denmark, Georgia, Italy, the Netherlands, Poland, Romania, Spain, Ukraine, the United Kingdom, and the United

States again invaded the Republic of Iraq in a mission given the operational code name “Iraqi Freedom.” Iraq was quickly overwhelmed within a few weeks of the start of the campaign, resulting in the removal of Saddam Hussein from power and the Coalition Provisional Authority being installed. In the war’s aftermath, coalition leaders began to rebuild Iraq’s military forces in similar fashion to that of the ANA in Afghanistan. The Coalition Military Assistance Training Team, a section of the Multi-National Security Transition Command, Iraq, established to organize, train, and equip a new Iraqi army, began its first recruitments in August 2003. Established at the request of the Iraqi Interim Government, the NATO Training Mission, Iraq emphasized training and mentoring for Iraqi officers, noncommissioned officers, and enlisted personnel. Coalition forces soon captured Hussein and turned him over to the Coalition Provisional Authority for trial. Over the next 2 years, insurgents began a campaign of violence against coalition forces until in 2007, when President George W. Bush ordered additional U.S. forces into Iraq to suppress the attacks that had steadily been increasing. As the surge began to take effect and insurgency attacks declined, coalition forces determined that the Iraqi army had become proficient enough to begin military operations on its own beginning in 2008. As the United States began to reduce its combat presence in Iraq in 2010, the name of the mission changed from Operation Iraqi Freedom to Operation New Dawn.

Contemporary Multinational Training

With the launching of Operation Enduring Freedom and Operation Iraqi Freedom, multinational training again evolved to include new partners conducting operations in Afghanistan and Iraq. To meet this need, the 7th Army Training Command became the Joint Multinational Training Command (JMTC), and the Combat Maneuver Training Center became the Joint Multinational Readiness Center in 2005. The JMTC and the Joint Multinational Readiness Center provide a state-of-the-art training platform for NATO and other multinational allies to build and sustain their operational capacity. The command’s capabilities and proximity to European, Asian, and African partners make it the unrivaled choice to support Security Force Assistance programs such as the ISAF in Afghanistan; the Multi-National Forces, Iraq; the NATO Training Mission, Iraq; and

other coalition initiatives. The Joint Multinational Readiness Center is the largest U.S. Army Europe–maneuver training area in Europe with more than 60,000 coalition soldiers training there annually.

The demanding training regimen includes professional opposing forces, observers, controllers, and trainers at the Hohenfels Training Area who provide intensive, “real-world” maneuver-combat training from the individual to the brigade staff level. According to JMTC, nearly 4,000 multinational soldiers have completed specialized functional training at the Command Arms Training Center; more than 5,000 have completed the Operational Mentor and Liaison Team training at Hohenfels Training Area; and nearly 600 International Military Students from 27 countries have completed the Warrior Leader Course at the 7th Army Non-Commissioned Officers Academy. In 2010 alone, the JMTC’s simulations center conducted 8 major theater engagement exercises. Since 2003, there have been 55 significant events with more than 10,000 multinational participants.

Challenges and Goals

Language

Language has long been an obstacle for the military forces from different nations who train and fight together. Language proficiency is a vital part of the training for members of specialized units that operate clandestinely, such as the U.S. Army Special Forces. Most recently, the participation of the United States in Operation Enduring Freedom and Operation Iraqi Freedom placed a need for linguistic experts who were proficient in Arabic, Dari, and Pashto. After careful screening, native speakers from the host nation were assigned as interpreters to units to bridge the language gap.

Culture

Respect for a host nation’s customs and beliefs also pose a problem for the military forces from different nations that train and fight together. Some Middle Eastern nations with Muslim majorities forbid their citizens to consume alcohol. This belief poses problems for the military forces of nations whose cultures allow alcohol to be consumed when they participate in training exercises in the Middle East. Working women and military women are sometimes viewed negatively in these countries, especially Saudi

Arabia. Military commanders from nations where a majority of people practice Christianity have to be vigilant during multinational training events and operations so as to avoid a possible confrontation not only between the various military units but also with the host nation and its inhabitants.

Politics

Political considerations are always paramount when the various military forces from different nations train and fight together. The selection of commanders, the forces involved, and logistical concerns all can change at a moment’s notice due to political concerns. Toward the end of World War II, the Allies’ focus shifted from the defeat of Nazi Germany to how Europe would be governed in the war’s aftermath. As evidenced by the adversarial activities of the Soviet Union and the United States during the Cold War era, alliances can, and do, fall apart.

TRAINING, NAVAL AVIATORS

Naval aviation demands determination, skill, and physical prowess. All naval aviators undergo extensive training, first at the Aviation Preflight Indoctrination (API) in Pensacola, Florida, and then

at one of the three 22-week-long primary training pipeline programs where the rigorous curriculum tests future aviators physically and academically while also acquainting them with the basis of naval aviation. Marine Corps aviators are also trained at U.S. Navy facilities. The chief of naval air training, located in Corpus Christi, Texas, oversees the Naval Air Training Command, and it is his or her duty to safely train and produce combat-quality aviation professionals for two different environments—water and land.

Naval Aviator Qualifications

Naval aviator applicants must be commissioned as officers before turning 28, be a citizen of the United States, and have a bachelor's degree from an accredited college/university or from the United States Naval Academy in Annapolis, Maryland. The applicant must be a commissioned officer at the rank of ensign.

To meet these requirements, prospective aviators must choose one of several educational options. Candidates may enroll in a Naval Reserve Officers' Training Corps (NROTC) program at their college/university. Along with regular academic courses, the candidate must also participate in and attend military classes and drills and report to midshipman cruises during the summer. Another option is the Officer Candidate School (OCS) at the Naval Air Station in Pensacola, Florida. This is a 12-week intensive training course in military studies and the basic rules and regulations of the navy, with intensive physical conditioning (especially swimming) and a basic course in naval propulsion. Alternatively, candidates may enroll in the United States Naval Academy, but only about 10%, or 1,300, of applicants are accepted there each year. The bulk of naval aviators, nearly 80%, come from the U.S. Naval Academy or NROTC programs, whereas fewer than 20% come from OCS.

Aviation Selection Test Battery

The U.S. Navy uses the Aviation Selection Test Battery (ASTB) to narrow down the applicant pool. Only 50% of the 10,000 candidates who sit for the exam each year will pass.

The exam lasts for 2½ hours and consists of six tests: (1) math, (2) reading, (3) mechanical comprehension, (4) spatial apperception, (5) aviation and

nautical information, and (6) aviation supplement. Those who pass the ASTB then proceed for their flight physical.

Physical Exam

Applicants must also pass a flight physical that, among other items, focuses on a candidate's ability to withstand high g-forces as well as the more general rigors of flight. Applicants must have 20/20 vision and cannot be colorblind or have depth perception issues (the navy will accept applicants who have had laser corrective eye surgery). Approximately 25% of applicants fail their flight exam. Of those who pass, only half are invited into training programs as the supply of physically sound candidates exceeds the navy's demand for pilot trainees.

Ground School

Ground school coursework consists of training in basic engine properties, aerodynamics, navigation, and specific aircraft systems and lasts approximately 4 months. This includes ground school coursework, flight simulator sessions, and actual flight time in the T-34C Mentor. Upon completion, naval aviators are sent to one of three specific aircraft training programs: (1) maritime pipeline, (2) jet pipeline, or (3) helicopter pipeline.

Flight School/Training

Student aviators first enroll in Introductory Flight Screening to learn how to fly. Students must complete 25 hours of flight training and one cross-country flight. This later requirement tests the student's knowledge and ability in managing an aircraft in flight. Those who have a pilot's license can skip this step and proceed to the next stage.

Student naval aviators (SNAs) go through a long and rigorous training—typically, 18 months to 4 years. For 6 weeks, they go through aviation pre-flight indoctrination to learn flight rules and regulations, aerodynamics, aviation physiology, turbine engines, and air navigation in a classroom setting in Pensacola, Florida, at the Naval Air Station. Trainees learn how to use special equipment to cope and survive if they find themselves in water after an aircraft mishap. After this process, they will go on to learn primary flight training at Whiting Field in Milton, Florida, located on the Panhandle, or at Corpus Christi, Texas, for 22 weeks. Trainees will

start hands-on training with a T-34C Turbo Mentor, which is followed by ground school (aircraft systems, local course rules, and emergency procedures), familiarization, basic instruments (used during maneuvers), precision aerobatics (rolls, loops, and tactical maneuvers), formation, radio instrument navigation, night familiarization, and visual navigation. By the time training ends, trainees will have spent 100 hours in the air/flight simulator.

Intermediate Student Naval Aviators Training Paths

With the completion of the training already described, SNAs begin more training at various bases. In Oklahoma at Vance Air Force Base, aviators begin training on the T-1 Jayhawk and the E-6B Mercury. At the Naval Air Station in Corpus Christi, Texas, aviators train on the T-44A Pegasus or TC-12 Huron. Helicopter training takes place at Whiting Field, Florida, on the TH-57B/C. Those who qualify are chosen to go further into the advance program listed below.

Advanced Student Naval Aviators Training Paths

Students in the Advanced Strike pipeline—at Kingsville, Texas, or Meridian, Mississippi—train for 23 more weeks with 67 additional flights and learn advanced instruments, carrier qualification tactical formation flying, bombing techniques, and capabilities. When their training is complete, the pilots fly versions of the F-18 Hornet and Super Hornet as well as other top-of-the-line aircraft.

E2/C2 pipeline SNAs go to carrier qualification in the T-45 Goshawk with 20 additional flights for more than 8 weeks. After completion, they go to Corpus Christi, Texas, to complete multicrew and multiengine training, which takes 16 weeks in the T-44A. When the SNAs get their wings, they fly E-2 Hawkeye or C-2 Greyhound aircraft.

Rotary-Wing pipeline SNAs learn to fly helicopters at Whiting Field, Florida, where they learn night maneuvers, tactics of rotary-wing aviation, use of night vision goggles, navigation, and how to land on a moving platform. When this training is completed, they report for Seahawk training.

Maritime pipeline SNAs complete training in Corpus Christi, Texas, flying a twin engine T-44 Pegasus or TC-12 Huron. Emphasis is placed on

single-engine flight in various weather conditions. When SNAs receive their wings, navy aviators fly the P-3 Orion, whereas their Marine counterparts fly the KC-130 Super Hercules.

Student pilots selected for helicopter training report to Naval Air Station Whiting Field, Florida, and complete advanced training in the TH-57 Sea Ranger, where they learn the characteristics and tactics of rotary-wing flight. In addition, they learn shipboard landing on the helicopter landing trainer, the navy's only ship for teaching helicopter pilots how to land on a moving vessel. When they earn their wings, navy pilots report to Fleet Replacement Squadron for SH-60, CH-46, or MH-53 training whereas Marine helicopter pilots use the AH-1, CH-46, MH-53, or UH-1 FRS.

Attrition Rate

Attrition in the training of naval aviators is costly for the navy. For each failure of an aviator prospect, it is estimated that \$500,000 to \$1 million is lost. Although the reasons for attrition vary, the most common causes are poor academic performance, problems performing flight maneuvers, and people choosing to leave. For the past 30 years, the attrition rate has remained steady at between 15% to 25%. The majority of these failures occur during the first 100 hours of flight training.

The Growth of Naval Aviation, 1909 to 2009

The U.S. Navy's official interest in controlling the skies developed as early as 1898. By 1909, with the displays of the Wright brothers' first flight at Kitty Hawk, North Carolina, naval officers were pushing for the purchase of aircraft. Soon the navy and Captain Washington I. Chambers, officer in charge of aviation, established the National Committee for Aeronautics to work on aerodynamics and hydrodynamics. The first naval officer to be in the program was Lieutenant Theodore G. Ellyson in December 1910. On March 4, 1911, the first funds for naval aviation were appropriated, providing \$25,000 to the Bureau of Navigation. Greenbury Point in Annapolis, Maryland, became the site of the first naval aviation base on July 6, 1911. The navy received its first aircraft from Curtiss Company in July 1911. Ellyson assisted Glenn H. Curtiss, who showed the airplane's capability at sea when he completed the first successful hydroaeroplane flight,

landing his seaplane near the USS *Pennsylvania* where the ship's crew hauled the plane aboard.

Naval aviators first saw action on April 20, 1914, during the Mexican crisis. Three pilots, 12 enlisted men, and 3 aircraft sailed from Pensacola, Florida, to join the Atlantic Fleet off Tampico, where they conducted reconnaissance missions flying from the USS *Mississippi*. Although naval aviators proved their worth, only one air station was in operation, with 48 aviators and students and 54 aircraft, by the time the United States entered World War I in April 1917. Given the extraordinary demands of war, training programs and air stations were established across the country and the Naval Reserve Flying Corps produced thousands of aviators, ground officers, mechanics, and technical specialists. Technological developments in American naval aviation during World War I included the long-distance flying boat and constant air offensive attacks. The flying boat was impressive, and naval aviators urged its adoption as a means of taking air power to sea.

During the interwar period, the growth of naval aviation diverged from the moribund situation then prevalent in the other services. By 1919 navy leaders were pushing for the development of the aircraft carrier, which became a reality with the commissioning of the USS *Langley* in 1922. By the time the United States entered World War II in December 1941 the growth of the fleet air arm necessitated an enlarged training program designed to accommodate 800 students per month. Shortly after Pearl Harbor, that number grew to 2,500 trainees per month.

During the Cold War, the navy's reliance on aircraft carriers to project American military power far from the republic's shores meant that aviator training remained a critical component of the postwar navy. By the time America entered its first Cold War conflict in Korea, navy aviators were routinely trained to fly both rotary and newer jet aircraft, while in the following decade the war over Vietnam required new training to deal with advanced surface-to-air missiles and a new generation of MiG fighters. Throughout the Cold War, navy aviator training also produced air crews that carried on the vital work of antisubmarine warfare, tracking and preparing if need be to engage the mammoth Soviet submarine fleet.

The performance of U.S. Navy and Marine aviators in the Global War on Terrorism and campaigns

in Iraq, as well as existing plans to construct the new *Ford*-class supercarrier, point to the continuing need for trained aviators.

Future of Naval Aviation

Naval aviation is in the process of transitioning to newer models/aircraft. The chief of naval air training is modernizing and downsizing from seven-type model series of aircrafts with 11 configurations to four-type model series and configurations. In primary training, the T-34C Turbo Mentor that has been in use for 30 years is being replaced by the T-6B Texan II, which has more horsepower, a completely digital glass cockpit, and ejection seats. Training Air Wing Five at Whiting Field, Florida, is currently transitioning to the T-6B, and Training Air Wing Four in Corpus Christi, Texas, will be complete in 2014. A new Multi-Service Pilot and Multi-Service Naval Flight Officer Training System enables a greater degree of course flow flexibility while providing more objective grading to ensure specific and required knowledge, skills, and experiences developed throughout each training stage. A tracking system follows the naval aviators from first flight to final flight to ensure that the aviators are progressing properly and to provide further training for identified weaknesses.

TRAINING, NAVAL ENLISTED

Naval training is a career-long process that begins with basic training and only ends when a sailor leaves the navy. The environment sailors operate in, whether it be on a ship, in an aviation squadron, in a submarine, or in a shore-based command, demands that they be flexible, adaptable, and resilient in the face of oftentimes rapidly changing scenarios. For example, sailors serving on ships are all required to be firefighters, small arms marksmen, and even food service attendants. Additionally, the recent conflicts the United States has entered into have demanded that sailors be prepared to operate in the deserts of Iraq or the mountains of Afghanistan in addition to the traditional realm of the oceans. Navy training is designed not only to give sailors technical know-how and teach them their traditional roles but also to prepare them to be adaptable.

Historical Precedents

During the early history of the U.S. Navy, the enlisted ranks were primarily filled by experienced mariners recruited in American and foreign ports. In the late 1800s, naval leaders made a conscious decision to systematically recruit sailors from interior regions of the United States with no prior maritime experience. This decision required the navy to develop a formal training program that would train unprecedented numbers of new sailors without previous maritime service. Initially, the navy established several training vessels, but in the early 1900s, it shifted most basic training, or boot camp, to land-based training stations that were initially established at Newport, Rhode Island; San Francisco, California; and Norfolk, Virginia. In 1911, the navy established the

Great Lakes Naval Training Station near Chicago, Illinois. Not all sailors went through boot camps, however, and naval vessels continued to recruit sailors directly to serve on them. Not until 1925 did the navy end the practice of direct recruiting by naval vessels. The navy maintained a number of land-based training centers until the early 1990s, when the Base Realignment and Closure Commission began to shut many of these facilities down. In 1996, the Great Lakes Training Station became the sole training center for naval enlisted recruits.

Boot Camp

The first step in transforming civilian recruits into U.S. Navy sailors begins when they report to boot camp. The navy's boot camp is held at Naval Station Great Lakes in the city of North Chicago, Illinois. With the closure of the Navy Training Centers in San Diego, California, and in Orlando, Florida, the Base Realignment and Closure Commission recommended that basic training be consolidated to a single source—at Recruit Training Command (RTC) at Great Lakes, Illinois. Today, RTC Great Lakes is responsible for the initial processing, orientation, and training of almost 40,000 civilians each year, transforming them into sailors in 8 weeks. This schedule is equivalent with basic training for the air force but is shorter than basic training for the army (10 weeks) and the Marine Corps (13 weeks). This difference is due to the fact that navy basic training is designed to provide only a baseline of skills common to all sailors independent of their intended rating (occupation).

The arrival and initial processing of navy recruits at basic training is similar to all services. Recruits typically arrive at night, are met by a Recruit Division Commander (an RTC staff training instructor), and begin their initial welcome to the navy. Each recruit is required to make contact with someone at home and inform them of his or her safe arrival. In addition to preliminary paperwork, personal civilian property is accounted for and taken for safe keeping, initial uniforms are issued (initially only a navy sweat suit), drug testing is conducted, and the recruits receive intensive medical, dental, and psychological testing to ensure their fitness for serving in the navy. Throughout the week, recruits also receive initial instruction on basic subjects such as standards of conduct, the Uniform Code of Military Justice, navy standards for personal organization, grooming, and navy values.

The processing week also introduces recruits to physical training. Navy Basic Training is designed to be rigorous and challenging in order to prepare men and women for a life different from what they may be accustomed to. The physical training program includes 1-hour of daily workouts 6 days a week, incorporating common shipboard skills with aerobic and strength training. During the fourth week of training, recruits are given their first opportunity to pass the Navy Physical Fitness Test. The physical fitness test includes a body fat measurement, sit-ups, push-ups, and a 1.5-mile run. Recruits are required to pass this test before graduation with a combined score of "good" (well above minimum navy standards). Recruits who cannot pass the test are rolled back to a follow-on recruit class until the test is passed, or, if after multiple attempts they remain unable to pass, they are dismissed from training.

During the next few weeks, more classroom instruction is added to provide more intensive instruction on basic procedures, operations, structures, and terms common to navy life. Classroom instruction in topics such as ship and aircraft recognition, military customs and courtesies, naval history, and first aid provide recruits with a foundation for future, follow-on training. Other classroom topics such as pay systems, equal opportunity, sexual harassment, basic financial planning, and additional instruction on the Uniform Code of Military Justice provide recruits with key life skills that will make their transition to military and professional life smooth.

In addition to classroom training and lectures, the next few weeks of boot camp include a great deal of hands-on, technical training. While most recruits will go on to serve on ships, submarines, or in aviation squadrons, Naval Basic Training at RTC is designed to provide a baseline of knowledge common to all sailors. Using a concept similar to the Marine Corps where every marine is trained as a rifleman, all sailors receive training in basic seamanship, damage control, water survival, and weapons handling. Basic seamanship training includes line handling skills used to moor and anchor ships in port, knot tying, and watchstanding such as look-out training, radio communications procedures, and other ship-based teamwork exercises. In addition to gaining individual technical knowledge and skills, recruits are also tested in their ability to function in a team, with everyone given an opportunity to assume

a leadership role. The damage control phase of training is a full 5 days of classroom and hands-on training that includes live training in a firefighting and flooding simulator. The water survival phase provides recruits with skills to enable them to survive if lost at sea and instruction on lifeboat operation and organization. In addition to the teaching and testing of these skills in a pool, at a minimum, recruits are required to pass the Navy Third Class Swimmer test at this point of basic training. While some specialized ratings will demand higher swimming skills, this minimum standard is a requirement for graduating from basic training. It is common for recruits to not have the requisite skills or background to pass this test, and these individuals are given extra instruction so that they are able to pass before graduation. As with the physical fitness test, if a recruit is unable to pass the swimming standards, he or she can be rolled back to another class or dismissed from training.

An additional focus of basic training was added as a result of the demands placed on sailors to stand security positions in the post-9/11 world. Prior to 9/11, recruits received only a minimum amount of small arms training in the form of small arms recognition and basic weapons safety concepts. Today, virtually all sailors are required to have a working knowledge and competent skill with small arms for security duties. RTC now includes 3 days of hands-on and classroom training on common navy small arms, including the Beretta 9mm pistol and Mossberg 12-gauge shotgun. In addition to classroom instruction and live-fire training, all recruits carry inert weapons during all watchstanding and security duties throughout their basic training. Live-fire training is still not conducted at RTC and is the responsibility of an individual command. However, the new focus placed on weapons safety and knowledge allows sailors to be more rapidly qualified.

Throughout the initial weeks of training, the focus of boot camp takes on a heavier concentration of teamwork and leadership skills. Training becomes more "real" to the recruits as they are learning skills that will be used in their pending profession. The pinnacle of the entire training period is known as "Battle Stations." This event stretches over 2 days and is designed to push recruits to their physical, mental, and emotional limits so that they are better prepared to function in real events. Based on the Marine Corps's Crucible, Battle Stations take an integrated approach, merging the classroom and

hands-on training received up to this point and then putting it to use in a real-world simulation that not only includes day-to-day operations of a ship but also incorporates damage with sophisticated special effects such as smoke, heat, sounds, and even smells, simulating combat. In all of the events of Battle Stations, recruits are graded as individuals and as a team. Team leaders are rotated to provide multiple opportunities for recruits to learn and gain confidence in individual and leadership abilities. If a team fails to meet a minimum standard, it is afforded the opportunity to attempt the scenario again until it passes, or otherwise all members of the team are rolled back to a follow-on class.

The Battle Stations scenario is set onboard the "USS *Trayer*," a 210-foot long mock-up of an *Arleigh Burke*-class destroyer. The scenario was conceived following the lessons learned from the attack on the USS *Cole* in Aden, Yemen, where 46 sailors were killed or injured and the remaining crew was able to save the ship from sinking only through training and ingenuity. The Battle Stations exercise consists of 17 events that are all designed to simulate an actual event a ship will or could go through during combat operations. The 12-hour test begins with a team of 8 to 11 recruits manning simulated watchstanding positions on USS *Trayer* and quickly shifts to simulated damage from enemy attack. Teams are tested in a variety of events such as dewatering a flooded gun magazine while simultaneously having to pass simulated 5-inch ammunition to support defending the ship. This event was based on actual events following the attack on USS *Tripoli*, which struck a mine in the Arabian Gulf in 1990. Team members are forced to make decisions to either save themselves, save the ship, or carry out their mission. They are then presented with a scenario in which they must escape from a space that is threatened with fire while having to move an injured sailor through a small hole cut in a bulkhead. This test simulates events from a large fire on USS *Forrestal* in 1967. Another scenario presents the recruits with a scenario from USS *Cole* with multiple casualties (simulated with life-sized dummies) and damage following a suicide bombing attack complete with smoke, sparking wires, and damaged walls and equipment. In all of the events of Battle Stations, teamwork is stressed above all else. None of the events can be passed by a single individual without the support and integration of effort from his or her fellow recruits.

The final event of Battle Stations comes only after the recruits have passed each of the challenges and is the point when recruits are referred to as sailors. Up until this point, each recruit has worn a hat labeling him or her as such. During the capping ceremony, the Recruit Division Commanders who have trained their charges over the past 8 weeks remove the recruits' hats and replace them with blue hats with "sailor" emblazoned in gold. This ceremony marks the end of the recruit phase of training.

Advanced Training

On graduation from boot camp, virtually all sailors attend some sort of specialized training before reporting to their first command. Generally, sailors report directly to technical school—"A" school—after graduation. These "A" schools are tailored to specific ratings or specialties, and sailors are usually assigned to these schools on the basis of requests made at the Military Entrance Processing Station. The navy has more than 60 specialized fields for recruits to choose from, broken down into occupational categories such as seamanship, aviation, and engineering. "A" schools are located on military bases around the country, and include institutions like the Submarine Leaning Center at Groton, Connecticut; Center for Security Forces in Virginia Beach, Virginia; Centers for Explosive Ordnance Disposal/Diving and Naval Aviation Technical Training at Pensacola, Florida; and the Center for Seabees and Facilities Engineering at Port Hueneme, California. Depending on the complexity of the subject field, training at these centers can take anywhere from several weeks to a number of months. On completing "A" school, many enlisted recruits assume their place in the fleet. Others, however, may require additional specialized training depending on the rating, or occupation, to which the sailor has been assigned. Ratings in the navy include mechanical ratings (e.g., gas turbine, diesel, or nuclear engineering; aviation machinist; electrician), electronics ratings (e.g., information technology, fire control, or electronics technician), special warfare ratings (e.g., SEAL or explosives ordnance disposal), or service support ratings (e.g., administration, logistics, or media services).

Naval training continues well beyond the completion of "A" school and the achievement of a rating. Indeed, it continues throughout a sailor's career and does not stop even after he or she has become an

expert in his or her rating. As sailors gain seniority, additional demands and expectations are placed on them, and they must continue their training to succeed and move up in rank. Navy training is fundamentally designed to be a career-long process to keep skills sharp and enable sailors to meet the constantly shifting challenges placed before them.

TRAINING, NAVAL OFFICERS

In the U.S. Navy, training and education for future and current officers take place across a spectrum of topics to ensure that commissioned officers are prepared for their duties in a number of different environments. Officer training is conducted primarily at the United States Naval Academy in Annapolis, Maryland, in the Naval Reserve Officers' Training Corps (NROTC) at higher education institutions around the country, and at Officer Training Command in Newport, Rhode Island. Graduate-level training is conducted at the Naval War College (NWC) in Newport, Rhode Island. The major commissioning programs for future officers are at the Naval Academy, the NROTC, and the Officer Candidate School (located within Officer Training Command Newport).

The U.S. Naval Academy

Naval Secretary George Bancroft founded the U.S. Naval School at Fort Severn in Annapolis, Maryland,

in 1845. Concerns over mutinied ships and poorly trained officers had prompted Bancroft to open the school where officers were educated through a fixed curriculum in subjects including mathematics, navigation, gunnery and steam, and French. In 1850, the Naval School would become the Naval Academy, and the original 10-acre campus gradually expanded to 338 acres. In 1933, Congress authorized the Naval Academy to award bachelor of science degrees, which are today offered in 18 major fields of study. Female midshipmen, who now comprise about 13% of incoming plebes, were first admitted to the Naval Academy in 1976 after Congress authorized opening the service academies to women the previous year.

Applicants to the Naval Academy must, in addition to applying to the institution, secure a nomination supporting their admission, usually from a member of Congress. The navy's stated mission for the academy is to educate future officers "morally, mentally, and physically," so the Naval Academy's educational approach involves combining professional military-related courses with more traditional academic subjects. Hands-on experience and training are emphasized, as are physical fitness and athletic programs. Midshipmen are educated in their chosen major field alongside required courses in subjects such as the natural sciences, engineering, the humanities, and others. These subjects are supplemented by courses aimed at developing leadership and professional skills in major areas such as sailing, seamanship and navigation, and waterfront readiness. Integrity at the institution is governed by an Honor Concept enforced by a Brigade Committee of upperclassmen. After completing their course of study, Naval Academy graduates commission in the navy or Marine Corps and serve a minimum of 5 years in uniformed service.

Naval Reserve Officers Training Corps

The NROTC, founded in 1926, provides college and university students a 4-year professional training program to be completed alongside baccalaureate coursework. The first group of 128 NROTC-educated midshipmen graduated from six schools in 1932. Since that time, the program has expanded to 59 NROTC units at more than 150 colleges and universities in the United States. NROTC offers opportunities to commission as an ensign in the navy or Navy Nurse Corps, or to commission as a second lieutenant in the Marine Corps. All students

enrolled in NROTC are referred to as midshipmen while in the program. The NROTC also provides scholarships to deserving and academically accomplished midshipmen students, with an obligation of 4 years of military service for those taking the Marine Corps and Nurse Corps options, and 5 years for those midshipmen taking the navy option. Those students not receiving NROTC scholarships are obligated to 3 years of military service.

The NROTC's mission, like the Naval Academy's, is to morally, mentally, and physically prepare midshipmen students for careers as Naval Reserve officers. Acceptance to the program depends on academic achievement and physical fitness, as well as agreement to military service. From initial summer cruise training (focused on career orientation and Atlantic/Pacific training) to regular physical training, midshipmen receive professional education that covers a range of fields, including naval science, calculus, physics, and national security.

Officer Training Command

Officer Training Command in Newport, Rhode Island, offers five officer accession programs. These include (1) the Officer Candidate School, (2) the Officer Development School, (3) the Direct Commission Officer Indoctrination Course, (4) the Naval Science Institute, and (5) the Limited Duty Officer/Chief Warrant Officer Program. Captain Vernon P. Kemper is the current commander of Officer Training Command, and the command's mission is to educate civilians, enlisted personnel, and commissioned officers through the range of programs offered.

Officer Candidate School, a 12-week program to prepare civilians or already-enlisted men and women to become commissioned officers, educates these future officers in military, academic, and nautical subjects. Classes at Officer Candidate School are generally comprised of two companies of 35 to 100 candidates. Coursework covers nine major areas, ranging from military law to warfare, and is supplemented by military training in drills, physical training, and personal standards and appearance.

The Direct Commission Officer Indoctrination Course is provided for direct commission reserve officers as they train for their new commissions. Over 2 weeks and more than 90 hours of coursework, officers train for fleet assignments and gain fundamentals of leadership and military doctrine in

the process. As with most officer training programs, a mixed approach of academic and physical education provides those in the Direct Commission Officer Indoctrination Course with working knowledge of navy programs, history, regulations, and tactics while encouraging physical health and well-being.

Staff Corps Officers and Restricted Line designators are prepared for their commissions in 5-week programs at the Officer Development School. Candidates take courses on naval policy, operations, and thought; receive training to handle and understand mental health issues and military law; and undergo rigorous physical training. The Limited Duty Officer/Chief Warrant Officer Academy has become a source of technical specialist education and career development in military law and naval history.

Finally, the Naval Science Institute provides the newest officer training program, the Seaman to Admiral 21 Program (STA-21), an enlisted-to-officer program. A by-product of the 1960s enlisted-to-officer training promoted by Chief of Naval Operations Jeremy Boorda (the first Chief of Naval Operations to have been an enlisted man), the program was given a reboot in 1994. Sailors at STA-21 continue to receive regular pay while on scholarship for their training, which totals around 18 university semester hours in six subjects—(1) naval science, (2) sea power and maritime affairs, (3) engineering, (4) weapons, (5) navigation, and (6) seamanship and operations. STA-21 candidates must also participate in heavy physical training and pass the navy Physical Fitness Assessment.

Naval War College

The NWC's mission is to provide professional military education to officers and enlisted men and women. Admiral Stephen B. Luce persuaded the Department of the Navy to establish an NWC in 1884, as no institution yet existed to educate naval officers on warfare. Since its inception, the NWC has been home to numerous U.S. military luminaries, including Alfred Thayer Mahan, Chester Nimitz, and Raymond Spruance. About 600 students graduate with master of arts degrees from the NWC each year, and its well-regarded distance learning option graduates around 1,000 students each year.

NWC coursework is focused on strategy, national security, wartime operations, and joint operations. Maritime Staff Operators training and the Maritime Advanced Warfighting School provide professional military education for officers and senior enlisted

personnel in the planning and execution of staff assignments. The NWC's focus on a career continuum of ethics, strategic development, and leadership development provides combat-ready leadership and incorporates partners from countries around the world in its educational goals.

Conclusion

The U.S. Navy provides numerous avenues of officer training for civilian recruits, enlisted sailors, and current officers. As the navy seeks to maintain its status as a powerful, high-tech, 21st-century force, the education and training of future navy leadership ensures that officers remain physically fit, up-to-date, and competent with technology, theory, and practice.

TRANSPORTATION, Air

Air transportation is one of three methods the Department of Defense (DOD) can choose to move personnel, equipment, and materiel rapidly to and from nearly anywhere in the world. This method has become, in large part, the preferred mode of transportation for the U.S. military. The overall unit in charge of strategic planning and readiness for all transportation missions for the DOD is the

U.S. Transportation Command (USTRANSCOM), one of the military's nine Unified Combatant Commands. The Air Mobility Command of the Air Force is the primary branch for the transportation of cargo through air, although the other branches do have some complementary airlift abilities.

Air Transport After the Cold War

At the end of the Cold War, the DOD realized that there were shortcomings in their current system of transportation of supplies throughout the services as well as around the world. At the time, a joint Air Force-Navy unit called the Military Air Transport Service was tasked with fulfilling the defense department's worldwide air transport needs. Various events ranging from the Berlin Airlift (1948–1949) to the support of military operations in Vietnam during the 1960s began to highlight these shortcomings in the air transport system. Perhaps the most important of these failings was the lack of substantial integration between the two branches and no overall commander responsible for resource allocation and decision making. Even after Military Air Transport Service was disbanded in favor of the Air Force's Material Air Command, the deficiencies still remained. As a result of this lack of cohesion, government officials demanded a better system for handling air cargo.

This led to the reorganization of the defense department's structure and assets, as well as a more integrated logistical and support system. Under the Goldwater-Nichols Department of Defense Reorganization Act of 1986, each branch still maintained separate transportation assets but reported directly to its new parent organization, USTRANSCOM. In turn, USTRANSCOM was to act as the intermediary between the DOD leadership and the individual services, as well as receive advice from the Joint Chiefs of Staff. The first major test of the effectiveness of the new structure was Operation Desert Shield/Operation Desert Storm in Iraq in the early 1990s. USTRANSCOM provided effective strategic airlift in terms of the aircraft involved and the amount of cargo moved and also served as an example of cooperation between the military branches.

Aircraft

The aircraft suitable for satisfying transportation requirements varies depending on mission requirements. Each branch utilizes its own aircraft to move

its cargo from location to location, although there are some interservice commonalities. The venerable C-130 Hercules, operated by every branch except the army, is used primarily as a medium-lift, medium-to-long range aircraft modified to fit each service's specific requirements. The air force specializes in moving large and heavy cargo and almost exclusively uses airplanes for its lifting needs instead of helicopters. The army has no official fixed-wing transport capabilities and must rely on one of the other services for support but usually provides extensive in-theater air transportation with several versions of the UH-60 Black Hawk. The navy, Marine Corps, and Coast Guard all have conventional airplanes as well as helicopters capable of fulfilling some of their transportation needs but are largely forced to either rely on the air force for heavy cargo movement or use various maritime options. For dignitary and high-profile passenger transportation needs, all of the branches use civilian aircraft modified to the services' requirements.

Logistics and Strategy in Air Transportation

There are many logistical issues that must be overcome to effectively maintain an efficient air transportation system. The manner in which mission requests are received and executed must be streamlined to prevent confusion, misappropriation of assets, and slow response times. Air units must also constantly report on their capabilities and limitations to their headquarters to ensure that missions are able to be safely and rapidly filled. During extensive or prolonged operations that necessitate elevated levels of air transportation support, commanders must also be wary of allocating too many aircraft for one theater while leaving too few for other operations. Finally, the amount of available funds for operations must also be closely monitored, as operations and maintenance cost can force missions to be altered or even cancelled.

Benefits of Air Transportation

Speed

Perhaps, the most beneficial aspect regarding air transportation is the ability to rapidly move almost anything from one part of the world to another. This is largely because of improved technology regarding navigation, engine efficiency, and lighter, more

streamlined airframes. Although the speeds of an aircraft vary and are always dependent on its laden weight and atmospheric conditions, traveling by air to distant locations is usually far quicker and easier than traveling by land or sea. This is perceived as an overwhelming advantage when rapid mobility and flexibility are becoming increasingly important regarding the military's global posture. Because of this relative ease, the U.S. military is able to place and sustain its forces around the world. Additionally, if an aircraft is capable of being refueled while still in the air, there is effectively no location that is unreachable by an aircraft.

Commonality of Cargo Containers Sizes

Second, the element of commonality in equipment allows for rapid and effective air transportation. All the services use uniformly shaped pallets and cargo netting to hold and transport most loads. These pallets and netting are designed to fit inside all of the primary transport airplanes and even some of the larger helicopters. In addition, any cargo that is not put on a pallet is designed to fit inside the fuselage of most conventional airplanes and be tied down. Although there are maximum size and weight restrictions for each aircraft, this means that nearly any load can be moved via air by almost any fixed-wing aircraft. As a result, every branch except the army is capable of delivering any small or medium loads by their airplanes to anywhere in the world in support of the other services instead of that service relying on its own transportation.

Obstacles to Air Transportation

While all of the following issues require consideration, several can be overcome with proper planning and logistical support.

Weight

Among the obstacles to air transportation is weight. Both helicopters and conventional airplanes have a maximum takeoff weight that cannot be safely exceeded without causing stress to the airframe and making it unsafe to fly. This forces those relying on air transport, to move personnel or equipment, to wait for suitable aircraft to fulfill their needs, or opt to use multiple aircraft if the load can be divided.

Adequate Space and Resource Allocation

Similarly, the need for adequate space influences air transportation. Obviously, large numbers of personnel can be better accommodated in bigger aircraft rather than smaller ones, making these aircraft in high demand to move large groups without breaking up the contingent. But large aircraft are also the most suitable for moving the heavy equipment needed for most operations, forcing planners to face a constant and delicate balance between mission needs and resource allocation. In addition to cargo room, having the necessary landing room for large airplanes is also a major consideration in planning an operation. While normally not an issue for helicopters and the CV-22 Osprey, an aircraft capable of taking off and landing like a helicopter but flying like a conventional airplane, traditional transport aircraft usually require longer runways because they are heavier and need more room to speed up and slow down. This limitation forces ground troops to undertake the time-consuming task of establishing a suitable runway for heavier aircraft or relying on medium-lift aircraft for support. Airdrops and the use of helicopters are two elements that can work to nullify this shortcoming, but they have their own inherent problems. Helicopters do not operate very well at higher altitudes because of the thin air, and airdrops run the risk of being damaged during the descent.

Maintenance

One aspect that requires careful planning is the constant maintenance required for transport aircraft. Because the military sustains the needs of real-world transportation missions, as well as supports other units training for a variety of scenarios and locations, transport aircraft are among the most flown in the world. As a result, maintenance on them is constant and to be expected. Yet any unscheduled maintenance, particularly if it involves critical systems, may force a deviation from scheduled plans and cause missions to be delayed or cancelled. If aircraft maintenance is not adequately prepared for and efficiently handled, it may dramatically affect forward-deployed personnel and force them to alter their plans.

Weather Conditions

Although modern aircraft are usually suitable for operating in all climates and weather, extreme

conditions may nonetheless affect how air transportation needs are met. Ice buildup on aircraft or washed-out runways can dramatically affect flying schedules. Equally dangerous is the possibility of low-flying aircraft kicking up debris on the ground and having it either ingested in one of the engines or cause damage to the aircraft's skin or nearby ground personnel. Helicopters in particular must confront this situation on every takeoff and landing. In addition, the powerful downbursts caused by rotating blades can create reduced visibility in certain environments. In desert environments, these are known as "brown outs," and in snowy conditions, they are referred to as "white outs." Although usually not dangerous in themselves, they may lead to temporary disorientation and vertigo; these are factors that aircrews must be able to deal with.

Aircrew Fatigue

Even though they are highly skilled at operating the aircraft, aircrew members invariably limit how air transportation is utilized, usually because of availability or endurance. Most crews are limited to a set number of hours they are allowed to fly per 24-hour period and are required to schedule rest breaks. Although this can be avoided by using more than one crew on multiday trips, airmen are likely to experience increased fatigue when continuously pushed to the limit. In addition, an augmented aircrew takes up more space than a regular crew, although this is usually a nominal factor when transporting cargo other than personnel. Finally, flight crews are required to be current on all their flight qualifications and cannot maintain proficiency if not given adequate time away from missions for their training. The constant strain on air crews to perform their tasks flawlessly, without the opportunity to safely make mistakes, can quickly erode their skills and can lead to accidents.

The Future of Air Transportation

Military airlift is expected to become increasingly important in future operations around the globe. Although moving supplies and personnel overland or by maritime means has its benefits, only air transportation can provide the flexibility of rapid global force positioning that military planners often require. In recognition of the critical role air transportation will have in future operations, the DOD has initiated plans to upgrade some of its medium- and

heavy-lifting aircraft. The Air Force's C-5 Galaxy fleet has gone through several modifications, such as receiving upgraded avionics packages and more efficient engines, extending the lives of existing airframes for at least 25 years. The ubiquitous C-130 Hercules has also undergone modernization and refits by all the armed services with several extensive modifications to suit the myriad missions that are regulated to this venerable aircraft. In addition, more C-130s are being built with newer engines, an improved flight deck with digital displays, and extensive computer automation of various systems that erases the need for a flight engineer or a navigator, all in an effort to pair technology with current and future operational needs. The futuristic CV-22 Osprey is part of the next generation of medium-lift aircraft, with its unique lifting and flying abilities, and will likely have an expanded role in military operations around the world.

Helicopters will also fulfill critical roles in future military air operations. While not as fast or capable of carrying loads for extended distances, helicopters fill the important mission of point-to-point air movement efficiently. Although capable airframes like the UH-60 Black Hawk and the CH-47 Chinook have been in service for several decades and undergone many improvements and modifications, increased operations have stressed the fleets of transport helicopters, forcing military planners to begin looking for other suitable airframes or to completely overhaul the existing fleets.

One aspect that might affect the wider use and evolution of air transportation is the cost of fuel. The fuel consumption of both real-world and training flight operations has led top-level military strategists to consider alternative fuel sources to decrease the dependence on oil. The air force, the U.S. military's largest user of oil, outfitted some test aircraft with modified fuel systems that use a synthetic blend of fuel and found a cleaner burn with little or no decrease in performance. While the results are promising, switching aircraft from an oil-based fuel system to one that uses a blend would be extremely costly and time-consuming.

TRAUMA, MILITARY SEXUAL

Military sexual trauma (MST) refers to unwanted sexual attention of a harmful nature (physical or verbal) experienced by men and women in the military. The definition is broad and covers a wide range of behaviors from sexual harassment (unwanted sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature) to sexual assault (rape, inappropriate sexual contact, or attempts to commit these acts). The event may occur on or off a military installation, in a combat zone, or stateside, or it may be a form of torture of a prisoner of war. MST is a term that is used widely in the Department of Veterans Affairs (DVA), where harmful effects of sexual harassment and sexual assault are placed in one category. The Department of Defense (DOD) seldom uses the term *MST* but rather separates sexual harassment and sexual assault into two categories. However, when unwanted sexual attention traumatizes military members, MST is an appropriate label to describe the event, whether it is sexual harassment or assault.

This entry discusses some of the mental and physical effects of sexual trauma and gives a brief history of U.S. legislative acts that address MST. There is also a brief discussion about some of the initiatives

taken by the DOD and the DVA to treat victims of MST and to prevent such acts from occurring in the future.

Physical and Mental Effects of MST on Victims

MST gained national attention in the early 1990s when several U.S. Naval and Marine Corps aviation officers were accused and convicted of sexually harassing and assaulting active-duty military women at an annual symposium. This widely publicized case, which became known as the Navy Tailhook scandal, sensitized the public to the sexual trauma that was taking place in the U.S. Navy and in other services. It served as a catalyst for the DOD to establish a comprehensive policy to respond to sexual harassment and sexual assault.

Sexual trauma in the military is often interpreted as being unique as compared with other social institutions such as work and school. Given the institutional realities of the military, MST can be particularly stressful as the victim and the perpetrator usually live and work where the event has taken place. In some cases, the perpetrator is in a position of authority over the victim, exacerbating a feeling of helplessness in the victim that can lead to reluctance to report the crime. Studies have shown that occurrences of sexual assault exceed the rates being reported. MST victims are often reluctant to report sexual assault to authorities because they fear ostracism, harassment, peer gossip, and that nothing will be done about it. Some researchers argue that the rate of MST is higher during wartime compared with the rates found during peacetime.

A substantial proportion of veterans screened during victim advocates (VA) health care visits reported recent sexual trauma. The rates of sexual harassment and sexual assault are high among military female veterans, and to a lesser degree, male veterans. Still, it is important to note that the incident of MST reported by military men has been significant. In a 2008 study that examined a cross-sectional sample of 89,960 veterans of Operation Enduring Freedom (in Afghanistan) and Operation Iraqi Freedom between 2002 and 2006, Rachel Kimerling and colleagues found that MST had been reported by 14.5% women and 0.6% men. Of these, 71.6% of the women and 73.9% of the men had been diagnosed with mental health conditions.

Similar findings were reported in 2010 with a sample of 164,603 Operation Iraqi Freedom/Operation Enduring Freedom veterans. In this study, 15.1% of the women and 0.7% of the men reported that they had experienced MST. Veterans who reported MST were significantly more likely to report mental health conditions than those who had not.

MST has been found to be the leading cause of several psychiatric and psychological illnesses, including posttraumatic stress disorder, depression, mood swings, anxiety, the inability to engage in intimate relationships, isolation, insomnia, drug and alcohol abuse, nightmares, compulsive working, and avoiding places or things that remind one of the trauma. In a national study of MST among military veterans who served in Iraq and Afghanistan and who used Veterans Health Administration mental health or primary care services between October 2001 and September 2007, MST was associated with increased odds of mental health diagnoses.

Additionally, several scientific studies have shown a relationship between sexual assault and physiological effects on victims. In a nonclinical statewide study, women who experienced sexual assault were more likely to have hypertension and high cholesterol than women in the study who had not been sexually assaulted. Similarly, looking specifically at women veterans who used Veterans Administration health care services, Susan Frayne and colleagues found that women veterans who had a history of sexual assault while on active duty were more likely to be treated for asthma, emphysema, and heart attacks than women veterans with no sexual assault history. Among some of the other reported illnesses, sexual assault victims are more prone to have arthritis, diabetes, and chronic lung disease.

Although most of the studies on effects of sexual harassment have been on female victims, there are some studies that show psychological effects to be similar in men. While gender differences in the effects of sexual assault have not been measured extensively, there have been some studies reported. A few studies show that compared with female rape victims, male rape victims suffer additional forms of stigmatization resulting from role expectations of men in Western societies. Examining preliminary data on men and women in treatment for acute sexual assault, Kimerling and her associates reported that male victims were significantly more likely to

have current psychiatric symptoms. In addition, they found men in the study to be more likely than women to have experienced a lifetime history of mental illness and psychiatric hospitalization.

High association between MST and negative health effects is partly attributable to the direct effects of the assault. For example, some sexual assault victims contract sexually transmitted diseases and/or sustain physical injuries during the assault. There are also indirect factors resulting from MST that may explain poor health in victims. Studies have found that MST victims are more likely than non-victims to smoke cigarettes, abuse drugs or alcohol, and/or engage in high-risk sexual behavior. Not all victims of MST experience debilitating symptoms. Investigators have found that responses of veterans vary according to their previous trauma history, their appraisal of the traumatic event, and the quality of social support following the trauma.

Legislation Addressing MST

Over the past decade and a half, Congress has directed both the DVA and the DOD to implement legislation addressing MST. During the early 1990s, a growing number of women veterans claimed that they had been sexually traumatized while on active duty. In 1992, women veterans testified before the Senate Veterans Affairs Committee in a series of hearings about suffering adverse effects from MST. Following these hearings, Congress passed Public Law 102-585, authorizing the DVA to extend health care services to all women veterans who had been sexually traumatized while on active duty. Health care was not provided for male victims of MST until later. In 1994, the Veterans Health Programs Extension Act was passed (PL 103-452), extending veterans health benefits to men who claimed to have been sexually assaulted while serving in the military.

DVA's authority to provide treatment to sexual assault victims was extended to December 2004 through the 1994 Veterans Millennium Health Care and Benefit Act. Sexual trauma services became a permanent benefit for veterans as a result of Public Law 108-422 in 2004. Since 1999, under PL 103-452, the DVA is required to conduct universal screening for MST of all veterans enrolled in the Veterans Health Administration. Veterans who are physically or mentally impaired because of in-service sexual trauma are eligible to receive VA disability benefits.

Reported acts of sexual abuse in the services influenced the 1995 DOD Directive 1350.2, which outlines policies on prevention and responses to incidents of sexual harassment in the armed services. Due to an increase in reports of sexual assault among men and women on active duty since Operation Enduring Freedom and Operation Iraqi Freedom, Congress directed the DOD to implement a sexual assault prevention policy in 2004. The policy calls for enhanced education and training programs in an effort to prevent sexual assaults. It also mandates an improved system of investigating and prosecuting military sexual offenders, as well as providing treatment and support for victims.

Support Programs and Treatment for MST Victims

Department of Veterans Affairs

The DVA established a Military Sexual Trauma Support Team to monitor MST screening and treatment and to coordinate MST-related education and training. The DVA has specially trained women veterans' coordinators, sexual trauma coordinators, and counselors in VA regional offices, medical centers, and Vet Centers to extend services to MST victims. Included in sexual trauma services is primary health care at DVA medical centers.

The DVA uses psychotherapy, including both cognitive and behavioral interventions, to address health concerns and to educate patients about the trauma. When appropriate, drug therapy is also used to correct biological imbalances and relieve symptoms associated with posttraumatic stress disorder and depression.

Department of Defense

In the late 1980s, the DOD began implementing several initiatives for the purpose of responding to and preventing sexual harassment. A Defense Equal Opportunity Council composed of senior officials to advise the assistant secretary of defense for force management and personnel on equal opportunity matters was established in 1987. The following year, the DOD administered a survey on sexual harassment of active-duty military personnel. Survey results revealed that 64% of the women and 17% of the men reported at least one instance of unwanted, uninvited sexual attention while at work in the

12 months prior to taking the survey. The study was replicated in 1995, 2002, and 2006. Each replicated survey revealed that overall reporting rate of sexual harassment had declined.

Each of the active services (navy, air force, Marine Corps, and army) has special protocol to address the issue of sexual assault. Sexual assault response coordinators and the VA work closely with the MST victims, assisting them with addressing issues such as safety against revictimization or retaliation for filing a report. The sexual assault response coordinator and the VA are also responsible for referring MST victims to medical, counseling, and legal support services. Service members who have been sexually assaulted have two reporting options: restricted or unrestricted reports. When a sexual assault victim files an unrestricted report, the victim is given medical care, and an official investigation is conducted. As of June 2005, victims of sexual assaults in the military justice system may file a report without consenting to an investigation. Restricted reporting allows victims confidential access to medical care, counseling, and victim advocacy services without reporting the event to law enforcement. Therefore, under the restricted reporting option, an official investigation of the assault will not be conducted unless the victim consents. MST victims may change their reports from restricted to unrestricted at any time; however, evidence gathered during the forensic examination is destroyed 1 year from its collection date.

Continued Need for Government Oversight

The 21st century has witnessed American women being assigned to military submarines for the very first time. During the war in Iraq, women soldiers accompanied U.S. Marine combat units on patrol and in house-to-house searches. With more women joining today's military and serving in roles that were previously held exclusively by men, MST will continue to be an issue in the foreseeable future. In August 2008, the U.S. Government Accountability Office recommended that the services provide the DOD with longitudinal data to allow for trend analyses. It is necessary for the U.S. military to continue studying ways of eradicating MST, and it behooves the U.S. government to provide oversight to ensure that military services are implementing appropriate policies to prevent and resolve sexual trauma.

TRAUMATIC BRAIN INJURY

Traumatic brain injury (TBI) is a type of acquired brain injury that occurs when a sudden trauma causes damage to the brain. Such injury can result

when the skull is pierced by an object or when the head collides with another object violently. Symptoms resulting from TBI can range from mild to severe, depending on the extent of the damage. Consciousness may or may not be lost, and there may be symptoms of headache (which in the case of severe TBI, gets worse or does not abate), confusion, agitation, fatigue, dizziness, weakness, and vomiting. There may be sensory issues such as vision and hearing problems as well as changes in smell or taste in addition to slurred speech.

TBI has often been called the signature wound of the Iraq and Afghanistan wars. In the case of personnel serving in the military actions of Operation Enduring Freedom and Operation Iraqi Freedom, most injuries are reported as resulting from improvised explosive devices. It is believed by veterans' advocates that between 10% and 20% of veterans of Iraq and Afghanistan, or 150,000 and 300,000 people, respectively, have some level of TBI. Among wounded troops, the rate of TBI rises to 30%.

In 2005, the Brain Trauma Foundation, supported by a grant from the Defense and Veterans Brain Injury Center, created the Guidelines for the Management of Combat Related Head Trauma. In response to a \$4.6 million grant from the Department of Defense, the Brain Trauma Foundation has developed a portable eye-tracking device that can be used on servicemen and servicewomen in the field to instantly determine if they have suffered any brain damage as a result of blast injury or another type of head injury. The researchers at the Brain Trauma Foundation have been working with engineers and researchers at the U.S. Army Research Institute of Environmental Medicine to develop this device that could revolutionize the way TBI is diagnosed and make it more likely that servicemen and servicewomen with brain injury get the care that they need. Another example of new methodologies is the Military Acute Concussion Evaluation for use on the battlefield. Military Acute Concussion Evaluation is a series of questions incorporating the Standardized Assessment of Concussion asked of injured soldiers as part of a mandated screening for all concussive combat injuries. However, the Military Acute Concussion Evaluation array is only useful for the first 12 hours after injury.

Still, TBI is the most common combat injury in the current theaters of American operations. In injury cases that do not involve penetration of the

skull, there are three primary types of damage. These involve *blast pressure* injuries and are characterized as *straight line*, *twisting*, and *contract/expanding* injuries. Straight line injuries are another name for concussion injuries, in which the brain is slammed around inside the skull, as in a car crash. Twisting injuries are caused by motion also and are characterized by the brain twisting on the spinal cord, resulting in tissue tearing and the brain scraping against the bones of the skull. Contracting/expanding injuries result from violent pressure changes in the brain as a result of exposure to shock waves from blast trauma. These injuries result in neurons changing shape. Prior to late 2011, many types of TBI were misunderstood, but new research is beginning to elucidate exactly what occurs in the brain as a result of these injuries.

Military leaders pledged to fix problems in diagnosing and treating brain injuries in 2007, but these efforts have been inadequate. There are certain disturbing trends noted in diagnosis and treatment. These include the fact that military screening systems routinely miss brain trauma in soldiers, whether in the field or back home. Millions of dollars have been spent on an exam called the Automated Neuropsychological Assessment Metrics (ANAM), which has been criticized as very unreliable. Even when injuries are diagnosed, the information often doesn't make it into soldiers' permanent medical files. Handheld medical devices for the transmission of data often fail in war zones. Hard copy records from combat areas have been lost, burned, or abandoned because no one knew where to ship them. When this official documentation is lost or nonexistent, wounded combat veterans have had to fight another battle for treatment. The military's traditional disdain for mental and emotional problems has affected treatment options, and some veterans have inappropriately been prescribed psychotropic drugs instead of rehabilitative therapy that could help retrain their brains. Others have received no treatment at all, or have been branded as malingerers.

In comparison with casualties in earlier conflicts, military casualties in Afghanistan and Iraq incur a greater percentage of injuries to the face, head, and neck, in part because of the frequency of combat injuries caused by improvised explosive devices. Personal protective equipment and armor have reduced death rates; however, this may have resulted in increased incidence of required TBI treatment

as head injuries that were previously fatal are now survivable. Consequently, cases of TBI are often missed. Moderate or severe TBI is very likely to have resulted in medical care in a military setting, and records of this care should be available to the psychiatrist. Other factors contribute to the possibility of a missed TBI diagnosis, including an incomplete appreciation of TBI consequences and the attribution of symptoms to other psychiatric diagnoses, and misperceptions of blast injury mechanics. On this latter point, a 2008 study of blast injuries in a civilian trauma center showed a missed diagnosis rate of 36% for primary blast-induced TBI cases. The complexity of trauma patients with other injuries may contribute to a missed TBI diagnosis, as may the incorrect belief that loss of consciousness is necessary for TBI.

Unfortunately, damage from these types of injury is not confined to the battlefield, or even to the injured warrior alone. Another issue associated with TBI is the prevalence of posttraumatic stress disorder (PTSD) in brain-injured veterans. The prevalence of PTSD in veterans of the Iraq and Afghanistan conflicts who are comorbid for concussive injuries is in the range of 33% to 39%, while the range of PTSD for veterans without concussive injuries is in the range of 10% to 17%, making the rate of PTSD among veterans with concussive injuries more than 100% higher than that for veterans without these injuries. Since most concussive combat injuries take place in an environment of traumatic stress, it is no surprise that PTSD is a concurrent phenomenon, and the impact of PTSD on the loved ones of the returned veteran is well known. Prior to the wars in Afghanistan and Iraq, the majority of studies on concussions and TBI were conducted with civilian injuries. The past decade allowed the military to successfully track soldiers with TBI.

On April 28, 2008, President George W. Bush signed into law the Traumatic Brain Injury Act of 2008 (P.L. 110-206). This legislation provided funding for fiscal years 2009–2012 for trauma-related research, treatment, surveillance, and education activities by the Centers for Disease Control and Prevention, the Health Resources and Services Administration, and the National Institutes of Health. It mandated improvements in the collection and dissemination of epidemiological studies on the incidence and prevalence of TBI in the military and veteran populations. The bill also ordered a study of

the ways in which members of the armed forces who have acquired a disability resulting from a TBI are being reintegrated into their communities. Legislation has been introduced in the U.S. Congress to reauthorize funding for traumatic brain injury programs but remained in committee as of June 2013.

TREASON

Treason was defined in the U.S. Constitution as

consist[ing] only in levying War against them [the United States], or in adhering to their Enemies, giving them Aid and Comfort. No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on Confession in open Court.

In 1948, Supreme Court Justice Robert Jackson stated that treason was “very narrowly defined in the U.S. Constitution and great difficulty is placed in the way of proving it by overt acts.” The Global War on Terrorism led to efforts by the federal government to expand the definition of treason and treasonous activities that had only limited success in the courts. At the same time, the administration of Barack Obama has killed Americans allied with al Qaeda and other terrorist organizations through covert actions, most notably through the use of unmanned aerial vehicles.

The framers of the U.S. Constitution defined treason narrowly because of the tyrannical use of “constructive treason” under English Common Law. Political opponents in Britain on several occasions brought capital charges against those accused of political crimes against the state (in practice, the British monarch). The consequence was that political dissidents were often executed for speaking against the king. The well-known case of Algernon Sidney, whose writings on political theory were used to support his execution in 1683, is said to have inspired a British law, Statute of 7 William III (1694), that required two witnesses, witness testimony, and a written indictment against the defendant in treason cases. This statute was the model for the framers of the U.S. Constitution, and the crime was thus defined in American law as action against the nation as a whole rather than used to condemn political expression against a political figure or party. This was also the reason for the requirement that the acts condemned under the treason statutes must be performed in wartime for the purpose of giving aid and comfort to the enemy.

Although the framers of the Constitution sought to narrowly define the crime of treason, Congress has sought to skirt these limitations in the Alien and Sedition Acts of 1798 and later in the Espionage and Sedition Acts during World War I. During the Cold War, the charge of treason was often hurled by Senator Joseph McCarthy of Wisconsin and other militant anticommunists against government officials in the administration of President Harry S. Truman. Charges of treasonous conduct proved central to the case of Julius and Ethel Rosenberg, even though they were not formally charged with treason.

Julius Rosenberg, an electrical engineer from New York City, was accused with his wife, Ethel, of acquiring the secret of making an atomic bomb from the highly classified U.S. government's Manhattan Project and providing it to the Soviet Union at a time when America owned a monopoly on the technology and scientific knowledge of the weapon's construction. The Rosenberg spy ring was active only for a short time during World War II, and the information, obtained primarily through Ethel Rosenberg's brother David Greenglass, a Manhattan Project machinist, was provided to the Soviet Union at a time when that country was a wartime ally of the United States. Nonetheless, the Rosenbergs were convicted and sentenced to death under wartime espionage statutes. Judge Irving Kaufman specifically referred to treason when sentencing the couple in 1951. As a result, though the Rosenbergs were convicted of conspiracy to commit espionage, the penalty carried out in 1953 was widely seen as having been imposed for implied treason despite the fact that treason carries a greater burden of proof for a conviction. Additionally, since the widely publicized trial was held during the Korean conflict of 1950–1953, the attendant hysteria surrounding McCarthyism is believed to have influenced popular opinion, which led the federal courts to expedite the couple's conviction and execution.

In 1985, Jonathan Pollard, a U.S. Navy intelligence analyst, was arrested for providing classified U.S. intelligence material to Israel. Pollard's defense in court (and in the media, where his views were widely disseminated) was that he and his wife were providing material that an ally (Israel) should have been getting from American sources but was being denied. The Pollards claimed a moral right as Jews to assist Israel in every way possible. However, Secretary of

State Caspar Weinberger submitted a classified statement to Pollard's judge, which apparently described the damage Pollard had caused to American security (it is believed that Pollard's stolen material was being provided to the Soviet Union during the 1980s, with Pollard's knowledge). Since Pollard was convicted based on classified statements and not in open court, there is some question regarding the statutes under which he was sentenced to life imprisonment and the reasons for this unusually harsh sentence. Much like the Rosenberg case, Pollard was convicted of conspiracy to deliver national defense information to a foreign government. Since his imprisonment, Israeli leaders and influential Americans have called for Pollard's release.

The USA PATRIOT Act, passed shortly after the terrorist attacks of September 11, 2001, expanded the definition of terrorism to include any acts that "appear to be intended to intimidate or coerce a civilian population; to influence the policy of a government by intimidation or coercion" (PL 107-56/Section 802). The PATRIOT Act also enhanced the penalties for treason. The issue appears to be again that penalties for treason (which is notoriously hard to prove) may be invoked for lesser crimes.

John Walker Lindh was a young man from California who converted to Islam and served with the Taliban in Afghanistan. Though the treason statutes were invoked at the time of his arrest, it was not conclusively proven that he had taken up arms specifically against the United States. He did, however, admit to aiding the Taliban at a time when a state of war existed between the United States and Afghanistan, so he was sentenced to 20 years in a plea bargain that took treason charges off the table.

In 2006, a Southern California man named Adam Yahiye Gadahn (formerly Adam Pearlman), a member of al Qaeda, was the first American indicted for treason since 1952. Gadahn has appeared in many al Qaeda videos as "Azzam the American," advocating the murder of Americans and the destruction of Los Angeles. Although Gadahn publicly renounced his U.S. citizenship, destroying his passport on video, he did not complete the official paperwork that would have legally separated him from U.S. citizenship and protected him from prosecution for treason. In June 2013, Gadahn was listed on the Federal Bureau of Investigation's most wanted list.

There is some question about the applicability of treason statutes to recent cases. There have been

several high-profile cases of espionage involving the sale of military secrets to China. The most significant of these is Noshir Gowandia, a naturalized American born in India in 1944. Gowandia was a project engineer on the B-2 stealth bomber and helped design the technology that makes the plane resistant to heat-seeking technology. Later, he was a contract engineer at Los Alamos National Laboratories. Upon his arrest in 2005, Gowandia had collected more than \$110,000 from the Chinese government for designing an improved exhaust nozzle for Chinese cruise missiles. Though technically Gowandia could have been sentenced under the treason statutes as an American citizen, his 32-year prison sentence was for unlawful exportation and transmission of classified information.

In addition to the controversies stirred up by treason charges and trials, questions over the rights of American citizens have arisen in response to the targeted killings of individuals such as Anwar al-Awlaki. Born in New Mexico to Yemeni parents, al-Awlaki earned a degree in engineering at Colorado State University in 1994. He later came to believe that the United States was attempting to destroy all Muslims, and he joined al Qaeda and advocated a violent jihad against America. He successfully recruited individuals for the cause, closely communicating with Nidal Malik Hasan, accused of the 2009 Fort Hood shootings, and Umar Farouk Abdulmutallab, convicted of attempting to blow up Northwest Airlines Flight 253 in December 2009. In 2010, the Obama administration approved al-Awlaki's inclusion on a list of terrorists marked for capture or for killing, and on September 30, 2011, al-Awlaki was killed in Yemen by a predator drone.

The treason statutes in American law arose from humanitarian and egalitarian impulses on the part of the framers of the Constitution. During the 20th century, the Espionage Act was used to skirt the narrow constitutional definition of treason, and, more recently, the USA PATRIOT Act has extended the definition. The continuing Global War on Terrorism may see the increasing use of treason statutes in an effort to hold accountable members of al Qaeda and other terrorist organizations.

TRICARE (MILITARY HEALTH PLAN)

TRICARE is the health care program of the Department of Defense (DOD) for active-duty members of the armed forces. It serves members of the army, navy, Marine Corps, air force, Coast Guard, Public Health Service, and National Oceanic and Atmospheric Administration and includes activated

National Guard and reserve members, their families, and survivors. In addition, it also offers the health care for retired service members and their families separately.

Summary of Programs

Based on the different statuses and needs of beneficiaries, TRICARE offers multiple health care plans. Active-duty service members and their families can receive medical treatment from military treatment facilities or a contracted civilian medical provider through TRICARE Prime without any fee or co-pay. This program is similar to a civilian health maintenance organization (HMO). After service members fill out an enrollment form and submit it to the regional contractors, they are assigned primary care managers, who oversee routine medical care and make referrals to specialists in the network as needed.

TRICARE Extra and TRICARE Standard offer health care services on a fee-for-service plan, similar to a civilian preferred provider organization (PPO). TRICARE Standard is available for active-duty family members but not for the military members themselves. This plan enables beneficiaries to choose civilian medical providers beyond the TRICARE Prime network with the additional costs of deductibles and co-pays. No prior authorizations are needed for specialists as is needed under the TRICARE Prime plan. TRICARE Extra offers beneficiaries discounts in the TRICARE Extra network of service providers without enrollment and monthly pay.

TRICARE for Life was established in 2001 to reimburse costs that exceed the coverage of Medicare for retirees aged 65 years and older or for families with Medicare benefits. Beneficiaries need not pay enrollment fees to use TRICARE for Life, although they must be enrolled in Medicare Part-B.

TRICARE Reserve Select, established in 2005, is available to selected members of the reserves and their families. Beneficiaries can share medical costs that were charged in a TRICARE-authorized service provider with TRICARE Reserve Select after they pay monthly premiums for themselves and their families. Beneficiaries can use military treatment facilities if space is available. Dental coverage is provided for all active-duty members automatically, and family members may enroll and pay additionally for

this coverage. TRICARE also includes a prescription drug benefit.

Budgetary Problems

In 1993, TRICARE replaced the Civilian Health and Medical Programs of the Uniformed Services, which had provided supplemental care for active-duty and retired family members in military and Public Health Service facilities, to contain the medical cost and to increase the satisfaction of patients. This reform initiative was in the context of introduction of “managed care” into the government health care system in both federal and state levels.

Despite its purpose of reducing military health care costs, the budget of TRICARE programs expanded drastically in the following years. The medical expense of the DOD more than doubled between 2001 and 2009, from \$17 billion to \$44.8 billion, and further increase is anticipated. The reason the expanding cost is composed of several factors, including the increasing cost of civilian medical care, the start of TRICARE for Life and TRICARE Reserve Select, and relatively lower contribution of beneficiaries than private health care plans.

The growing medical cost has over the past several decades consumed a greater share of the defense budget. Although the DOD has sought to impose higher charges to beneficiaries since fiscal year 2007, Congress has refused to make significant changes.

In 2011, Secretary of Defense Robert Gates called for an increase in the user fees charged to military retirees. Gates declared that the ballooning cost of health care threatened military effectiveness if the growth in health care spending were not reduced. Among the proposals made by Gates and the administration of President Barack Obama were calls to increase the premium charged to wealthier military retirees. Veterans groups protested these cuts and successfully lobbied Congress to forestall any significant increase in the cost sharing expected of military personnel or retirees.

Conclusion

The introduction of managed care into military medicine did not wholly resolve the problem of rein-ing in health care expenditures. At the same time, to tighten the availability of health care in a single uniform way seems not to be the answer. In the minds of defense officials, the accessibility to health care by

service members and their families is crucial to sustaining an all volunteer force. As the U.S. Congress and executive branch examine possible options for decreasing costs, the trade-off between budget cutting and the accessibility of military health care will continue to be a central issue.

as a democratic, secular, and social state governed by the rule of law. The Turkish political system is based on parliamentary democracy. The executive power is vested in the government. Parliamentary elections are held every 4 years. Under recent constitutional amendments, the president will be for the first time directly elected every 5 years starting in 2014. The ruling party in 2012 was the Adalet ve Kalkınma Partisi: Justice and Development Party (AKP), which has Islamist roots. It secured a majority of seats in the Turkish Grand National Assembly in three consecutive general elections—in 2002, 2007, and 2011.

Turkey has been a member of North Atlantic Treaty Organization (NATO) since 1952, which constitutes its main defense commitment. However, NATO's contribution to Turkey's defense is no longer taken for granted. Reluctance on the part of some NATO members to invoke Article 5 guarantees, which states that any armed attack against one member of NATO is an attack against all, undermined the Alliance's credibility with the Turkish public and some decision makers. In 1990, just before the launch of Operation Desert Storm in Iraq, Ankara asked for deployment of NATO's Allied Command Europe Mobile forces as a sign of NATO's solidarity. Although Germany, Belgium, and Italy detached combat aircraft and the Netherlands deployed Patriot batteries to Turkey eventually, the tone of the public debate in some member states set in motion Turkish questioning of NATO's relevance to the country's post-Cold War security needs. The Turks were further alienated from NATO when French and German objections prevented it from invoking Article 5 in the case of Iraqi aggression against Turkey on the eve of the U.S. occupation of Iraq in 2003.

Defense and Security

Turkey's military is headed by a set of commanders known as the General Staff, with the chief of general staff reporting directly to the prime minister. The civilian-headed Ministry of Defense has an extremely limited jurisdiction over military matters and serves primarily as a procurement agency for the military. Under the general staff, there are three armed services: the army, the navy, and the air force. The two paramilitary services—the gendarmerie and the coast guard—are under the authority of

TURKEY

Located at the crossroads of Europe, the Middle East, and the Caucasus, Turkey is considered a multiregional power. It shares borders with Georgia, Armenia, Azerbaijan and Iran to the east; Iraq and Syria to the south; and Greece and Bulgaria to the west. Ankara, in central Anatolia, is the capital city. Turkey's population was nearly 80 million as of July 2012. The current constitution identifies the country

the Ministry of Interior in peacetime but are placed under the operational command of the army and the navy, respectively, in mobilization.

The Turkish military has traditionally played a prominent role in politics. It intervened directly three times, in 1960, 1971, and 1980, to oust civilian governments during the Cold War. The last military intervention was less direct than the previous ones and was carried out against the Islamist Welfare Party–led coalition, which was forced to step down in 1997. After the first coup in 1960, the Turkish military carved itself a constitutionally sanctioned role in politics. It remained the ultimate arbiter in domestic and international security issues over several decades. The armed Kurdish separatist movement led by the *Partiya Karkerên Kurdistan* (the Kurdistan Workers Party [PKK]) and the rise of political Islam offered further justifications for the military's expanded intrusion into politics well into the first decade after the Cold War. Political reforms in pursuit of EU membership have shifted the balance of power away from the military and toward civilians since 1999. The gradual alignment of civil-military relations in Turkey with democratic norms has resulted in a noticeably diminished role and voice for the military in politics. In the process, the previously military-dominated National Security Council lost its influence in foreign affairs and security policy. Although the National Security Council has survived the EU reforms, its composition has changed dramatically in favor of civilians. Moreover, its monopoly as the only specialized security policy institution of the country eroded with the introduction of the Undersecretariat for Homeland Security in February 2010.

Furthermore, several high-ranking serving and retired officers have been indicted and are currently being tried for their alleged involvement in an elaborate coup plot by an underground group called the *Ergenekon*. Included among the detainees in the *Ergenekon* and other related cases are a former chief of staff, the former commanders in chief of the Turkish navy and the Turkish air force, as well as the former commanding general of the First Army in Istanbul. The case may lead to a landmark decision in the evolution of civil-military relations in Turkey.

Throughout the 1990s, Turkey consistently ranked among the top 10 arms buyers of the world. Troubled relations with neighbors, including Greece,

Syria, Iran, and Iraq, and the PKK-led insurgency, justified extremely high levels of defense and security spending. After 1999, improved relations with neighbors and the stabilization of the PKK insurgency helped substantially reduce the defense and security budget, which needed to be curbed severely after a homegrown financial crisis hit the economy in 2001 with a 40% devaluation of the Turkish currency. The economy has steadily recovered, but with no corresponding increase in the defense budget. The defense and security budget has accounted for 1.8% to 2.4% of the gross domestic product in the first decade of the 21st century.

With slightly less than half a million servicemen and -women, Turkey is second only to the United States in terms of manpower among NATO countries. The army troop strength currently stands at about 370,000, the navy at about 50,000, and the air force at 60,000. These figures indicate a moderate decline since 2000. Conscripts still constitute the bulk of troop strength. In 2002, professionals accounted for nearly 17% in the army, 48% in the navy, and 55% in the air force. There are no definite plans for transformation into an all-volunteer, all-professional force in the foreseeable future. However, a partial professionalization is in progress in the army since the 2008 decision to man the army's five elite commando brigades with volunteers only.

Turkey has emerged as a major contributor to the United Nations, NATO, and other international operations since the end of the Cold War. In 1950, Turkey sent troops to fight in Korea under the United Nations Command and in the early 1990s participated in UN peacekeeping operations in Somalia. Ever since, Turkish army, navy, and air force units have been deployed for international missions from the Balkans to Afghanistan. Ankara also took the lead in developing multinational and regional peacekeeping capabilities, including the Southeastern European Brigade and the Black Sea Naval Co-Operations Task Force. Turkey has also declared a joint battlegroup with Italy and Romania. Finally, Turkish Corps III with headquarters in Istanbul is one of the four rapid-deployable corps (NRDC-T) of NATO. Turkish Corps III assumed the command of ISAF-VII mission in 2005. Since 2011, NATO has allegedly deployed three Patriot missile batteries to Turkey. German, American, and Turkish officers activated

the Patriots on May 1, 2013, to protect against any possible Syrian air attack.

Turkish Foreign Policy and U.S.-Turkey Relations

Since the foundation of the Republic in 1923, Western orientation has remained one of the hallmarks of Turkish foreign policy. Until the end of the Second World War, the West was identified mainly with Europe. Consequently, early republican diplomacy sought admission into the European States System or what was left of it after the First World War. The Soviet Union's ascendance to power after 1945 had immediate consequences for Turkey's security. Stalin's demands for joint control of the Turkish Straits and territorial claims in Eastern Anatolia propelled Turkey into the U.S. orbit. On March 12, 1947, Turkey along with Greece became recipients of U.S. military assistance under the Truman Doctrine against the military and ideological threat of the Soviets. Turkey's admission to NATO, again along with Greece, set the seal on Turkey's place among U.S. allies in the Cold War. The U.S.-Turkey alliance survived occasional crises such as Washington's secret deal with Moscow to withdraw the Jupiter missiles from Turkey in exchange for withdrawal of the Soviet missiles in Cuba in 1962; President Johnson's strongly worded letter to Turkey on the consequences of a possible military move in Cyprus in 1964; and, finally, the U.S. arms embargo on Turkey after Turkey's eventual military intervention in Cyprus 1974. Finally, the Turkish parliament vetoed the stationing of American troops on Turkish soil during the Iraq War in March 2003, causing tensions between Ankara and Washington.

During the Cold War, Turkey remained a Western outpost and hosted U.S. military installations and nuclear weapons. Turkey's real estate value for Western security evolved in line with the ebb and flow of tensions between the United States and the Soviet Union. The Soviet invasion of Afghanistan and the Islamic Revolution in Iran enhanced Turkey's significance for the United States and NATO in the last decade of the Cold War. As the Middle East came into sharp focus for Western security, the new U.S. strategy outlined by President Carter provided for Turkey's return to the Middle East, a region from which Ankara

had carefully distanced itself. The Defense and Economic Cooperation Agreement of 1988 revised the framework of U.S.-Turkey strategic cooperation to accommodate out-of-area contingencies.

The sudden end of the Cold War carried a potential to fundamentally alter the parameters of the relationship. However, the Persian Gulf War gave a new lease on life to Turkey's alliance with the United States. The U.S. investment in Turkey under the Defense and Economic Cooperation Agreement paid off when the Turkish government allowed the United States to operate combat and support aircraft out of Incirlik Air Base in southern Turkey. U.S.-Turkey cooperation during the Cold War temporarily masked the lack of a new strategic consensus between Ankara and Washington.

After the Cold War ended, the relationship began to feature elements of cooperation and competition, particularly in the case of Iraq. Between 1991 and 2003, Ankara and Washington substantially differed on the future of Iraq. While Turkey hosted U.S., British, and French aircraft under Operation Provide Comfort (subsequently named Northern Watch) to enforce the no-fly zone above the 36th parallel in Iraq, it had to deal with the consequences of an authority vacuum in the area. While the operation was meant to protect Iraqi Kurds, it also turned the area into a safe haven for the PKK, which stepped up its campaign against Turkish targets after 1991.

Along with the Persian Gulf War in 1991, the PKK insurgency set in train a major transformation of Turkish military. Having realized that sticking to Cold War tables of organization and equipment compromised mobility, flexibility, and the streamlined command and control needed to tackle post-Cold War threats, the Turkish General Staff switched to a battalion brigade-based army from a regiment division-based one. Dual deployment units were created with parent command deployed in the west, but sizeable units were detached to the southeast. Concurrently, the Turkish navy began to shift its focus away from the Black Sea, a major naval theater of the Cold War era, to the Aegean Sea for contingencies involving Greece and Cyprus. A new naval base was built in Aksaz, Marmaris, across from Rhodes.

The Turkish military mounted major operations (once with a corps-size unit) into Northern Iraq in pursuit of the PKK. In addition, Ankara had troubled relations with most of its neighbors,

including Greece, Armenia, Iran, and Syria. In the 1990s, Turkey's handling of its neighbors was marked by unilateralism and the use or threat of force. Such action did not meet the approval of Washington, which attempted to restrain Turkey by delaying delivery of critical military hardware, such as AH-1W Super Cobras, *Perry*-class frigates, and SH-60 Seahawks. Hence, the United States joined a host of other allies, such as Germany, Canada, and Norway, that imposed arms embargoes on Turkey, citing allegations of human rights violations. Under the circumstances, Israel stood out as an alternative supplier that would not attach any strings to arms deals with Turkey. In 1995, Ankara and Tel Aviv laid the foundations of close military relations, named after the first major military contract awarded Israel, "the Phantom Alliance," for upgrading of 54 Turkish F-4E Phantom II fighter aircraft. This was also regarded as a strategic act of balancing by Turkey against a potential military collaboration between its neighbors.

In 1998, Ankara successfully coerced Damascus to stop providing shelter to Turkey's public enemy number one, the PKK chief, Abdullah Ocalan, who was subsequently captured in the Greek Embassy in Nairobi, Kenya, by Turkish security agents with the help of the Central Intelligence Agency. After his capture, PKK attacks on Turkish security forces lost substantial momentum. The Ocalan affair and the 1999 earthquakes in Turkey and Greece helped the two countries mend fences and resulted in the removal of the Greek veto on Turkey's EU candidacy.

The 9/11 terrorist attacks on the United States and growing U.S. unilateralism in the Middle East gradually set Ankara and Washington apart. Turkey lent support to U.S.-led operations in Afghanistan to uproot the al Qaeda terrorists. Nevertheless, when the George W. Bush administration shifted its attention onto Iraq, Ankara's support could not be taken for granted. First, Turkey was apprehensive about the consequences on its territorial integrity of U.S. military action in Iraq. Toppling Saddam Hussein

A Turkish soldier speaks with a resident in Paymonar, Kabul province, Afghanistan.

Source: U.S. Navy photo by Petty Officer 1st Class Mark O'Donald.

could clear the way for the establishment of an independent Kurdish state in Turkey's neighborhood. Second, the recently elected AKP government was inexperienced and confused about how to respond to Washington's demand for basing about 60,000 U.S. troops in Turkey for its upcoming occupation of Iraq. On March 1, 2003, the Turkish Parliament voted down the government's proposal that would allow the United States to open a northern front against Saddam Hussein from Turkey. Many observers considered this a watershed moment in U.S.-Turkey relations that spelled the end of the strategic partnership phase. The AKP government also distanced Turkey from Israel after the latter's attack on Gaza in 2008. Relations between Ankara and Tel Aviv continued to sour. The AKP government excluded Israel from participation in the annual Anatolian Eagle exercises. A moment of crisis with Israel came in May 2010 when Israeli commandos killed nine Turkish citizens onboard M/S *Mavi Marmara* while trying to stop an aid flotilla en route to Gaza. Moreover, Turkish and U.S. assessments of Iran's nuclear ambitions did not initially overlap, nor could they agree on the best method for dealing with Iran. In May 2010, Turkey and Brazil struck a deal with Iran on a nuclear fuel swap, which did not go down well with the United States. Shortly after this deal, Washington secured Russian and Chinese support for sanctions on Iran. Turkey defied the U.S.-brokered resolution and voted against the sanctions on Iran in the UN Security Council. All of these developments raised the issue of whether Turkey was turning its back on the West.

Despite differences of opinion over Israel and Iran, Turkish-U.S. relations improved markedly under the administration of President Barack Obama. One reason is the changing regional context in the aftermath of the Arab Spring, also known as the Arab Awakening.

U

UNIFORM CODE OF MILITARY JUSTICE

Congress enacted the Uniform Code of Military Justice (UCMJ) in 1950, applying the code of military criminal laws to service members worldwide (Figure 1). The president implemented the UCMJ through the *Manual for Court-Martial*, which contains the Rules for Court Martial and Military Rules for Evidence.

The UCMJ brought into the modern era the U.S. military and criminal justice system, which commenced with the British Articles of War of 1774. The

American Articles of War predated the Declaration of Independence and U.S. Constitution. The Articles of War, written in 1775, governed military justice until after World War II. Military expansion and modern requirements required changes in the military justice system. During this era, approximately 16 million Americans served in the armed forces, with 2 million court-martial offenses that detracted from the war effort.

Overview

The UCMJ reserves jurisdiction over members of the armed forces. This is unlike civilian prosecutions, where the federal or state locality of a specific place reserves jurisdiction. The jurisdiction over service members is worldwide and does not depend on where the offense was committed. The status of the accused must be connected to membership in the armed forces. Therefore, active-duty service establishes military jurisdiction. The UCMJ applies to either regular active duty or reserve components serving on active duty. Moreover, even retired members of the regular components of the armed forces entitled to pay are subject to the UCMJ and court-martial under certain circumstances.

In addition, retired members of reserve components who are in a military hospital are also subject to the UCMJ and court-martial. Others subject to UCMJ include military prisoners, civilian members of organizations assigned to serve with the military, enemy prisoners of war in custody of the military, and persons accompanying the military in the field during times of declared wars.

Figure 1 Uniform Code of Military Justice System

The UCMJ gradually evolved from a military model of absolute command into a code that parallels the civilian “due process model.” The commander retains jurisdiction over minor infractions; however, for serious violations, the UCMJ court-martial remains the primary means for punishment. President Harry Truman signed the UCMJ into law on May 5, 1950, as Public Law 81-506, replacing and consolidating the laws of the various services. The law took effect in 1951.

UCMJ Offenses

The code describes substantive criminal law violations and punishable offenses similar to criminal federal and state codes. Serious crimes include homicide, rape and sex offenses, in addition to property and theft offenses, alcohol and drug offenses, and many other traditional crimes. UCMJ defines the legal elements of the offenses; for example, civilian statutes comparable to those listed in the UCMJ as Article 120, Rape; Article 124, Maiming; and Article 128, Assault. However, unlike in criminal law, the code does not distinguish between minor misdemeanors and serious felony offenses.

Military commanders can discipline with nonjudicial punishment, which means they have Article 15 powers under UCMJ, 10 U.S.C. §815. Other serious military offenses under the UCMJ include violations of general order, disrespect or contempt for officers or military leaders, and insubordination. The following specific military offenses are also subject to court-martial: (a) mutiny or sedition (Article 94), (b) insubordinate conduct (Article 91), (c) failure to obey an order (Article 92), and (d) misconduct of a prisoner (Article 105).

Moreover, many of the UCMJ’s offenses are not part of the civilian criminal justice system, while other lesser or minor offenses come under the commander’s purview. These offenses may result in harsh penalties intended to maintain discipline and good order. Certain unique serious military offenses—such as absent without leave, one of the most frequent offenses—have serious consequences for military responsibilities and deployment operations.

Article 134 Offenses

Offenses not covered under the UCMJ find authority and jurisdiction for court-martial under the UCMJ’s general article, Article 134. Many Article

134 punishments meet the approximate punishment requirements that apply to similar civilian offenses. Article 134 has expansive powers, which means that any federal or state offense where there is no related crime in the UCMJ may be assimilated into the UCMJ.

Article 134 would most likely be unconstitutional in civilian courts for being vague and not meeting the criteria of specific legal elements. However, it has suitable applications under military law for violations not listed under the UCMJ. For example, Article 134 can apply to (a) communication by threat, (b) drunk and disorderly conduct, (c) obstructing justice, (d) stalking, and (e) other offenses not specifically listed in the code. Court-martial authority for military offenses in the punitive articles of the UCMJ specify the elements of the offenses in 10 U.S.C. §877.

While some of these offenses have similar civilian legal requirements, others meet specific military requirements. For example, behaviors that are conducive to poor order and discipline and that bring discredit on the armed forces are the immediate target of Article 134. Violations of Article 134 are subject to court-martial, including (a) summary court-martial, (b) special court-martial, and (c) general court-martial prosecution. The punishment is in accordance with the nature and degree of the offense. The exception and limitation is the authority to administer the death penalty.

Death Penalty

The UCMJ authorizes the death penalty for specific crimes. In addition, certain crimes require the death penalty when the Congress declares war. There are differences for death penalty general court-martial versus court-martial in which the death penalty is absent. In death penalty court-martial, the convening authority requires and appoints a minimum of 12 commissioned officers who will serve as panel members (jury members). In cases in which the penalty is not a factor, the general court-martial only requires five officers. Refer to Figure 2 for the comprehensive requirements concerning the general court-martial and death penalty criteria.

UCMJ Article 32 requires a staff judge advocate be appointed as an investigation officer to conduct a thorough investigation before a trial by general court-martial. An Article 32 investigation is similar to a civilian preliminary hearing. UCMJ death

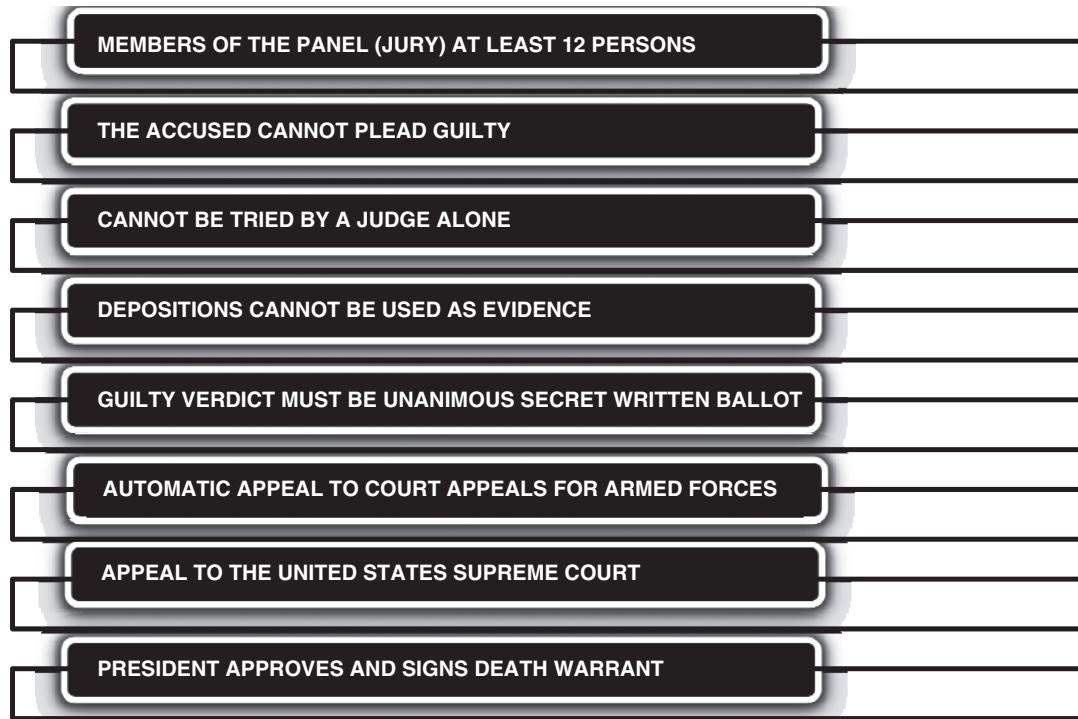

Figure 2 Death Penalty Requirements

penalty cases require the same rules of procedure and rules of evidence as any other general court-martial. Every general court-martial requires a UCMJ Article 32 investigation unless waived by the accused.

The investigating officer concludes the investigation and develops recommendations concerning the validity of specific charges and the proper forum for court-martial or exoneration of the service member. The chief military lawyer of the military reservation (staff judge advocate officer) makes formal statement recommendations under the authority of UCMJ. The convening authority has the power to authorize the potential punishment as a death penalty case and forward the charges for general court-martial.

The charges assigned to a military judge and general court-martial procedures are formally case initiated. General court-martial proceedings are similar to a trial in civilian federal or state courts. There are pretrial motions with regard to the legality of the evidence. The legal issues may involve arrest, search, and illegal evidence procedures.

The voir dire jury selection process seeks to eliminate prospective jurors who might be prejudicial or predisposed and, thus, would provide an unfair and unjust verdict. The prosecutors and defense offer their

opening statements, the presentation of evidence, and witnesses. Closing persuasive arguments by attorneys offer a dynamic close to the court-martial, followed by panel deliberations and voting.

Many of the UCMJ's criminal procedures are similar to federal and state procedural requirements. After the initial posttrial review, the death penalty court-martial is automatically docketed with the Court of Appeals for the respective branch of the service for mandatory case review in accordance with Article 66 of the UCMJ. Posttrial, the accused can make a motion to request clemency from the original convening authority. As commander in chief, the president of the United States formally approves the death penalty and signs the death warrant.

Conclusion

The primary goal of the UCMJ is to provide the necessary means for the commander to enforce good order and discipline. There are similar legal definitions and procedural patterns in civilian and military law. Military law and the UCMJ have specific legal criteria that apply to peacetime and combat military operations. The UCMJ provides the commander

with procedural opportunities for counseling, mentoring, and corrective training, not just punishment.

Military commanders have nonjudicial discipline authority under the UCMJ Article 15, which allows the commander informal procedures and nonjudicial punishments. Article 15 provides the means to discipline members of the armed forces without facing formal court-martial. The accused has the opportunity for appeal or the right to demand a summary court-martial. The balance of due process and military discipline is essential to the military justice system.

UNIFORMS

Whether in combat or far from the fighting zone, soldiers and sailors are required to wear special clothing. Uniforms are designed with both purpose and climate in mind. They vary by activity, rank, and service, and their presence speaks to the wearer's status and activity. In full dress blues, a general's uniform announces his rank and accomplishments, commanding respect. Donning a uniform also imparts tremendous responsibility to the wearer as a representative of the U.S. military.

Each service branch has its own uniforms and regulations regarding their usage. These rules dictate who wears what type of uniform, when the

uniform can be worn, and how it is to be worn (e.g., shirts tucked in, with undergarments). Codes also prescribe appropriate behavior when in uniform. Additionally, the military's uniform regulations define personal grooming standards, including hair length and style, facial hair, and jewelry.

Each branch has distinct regulations regarding uniform design and use of materials. Uniforms are designed for utility and for safety. Safety considerations include fire safety, noninterference with activities, and color and camouflage design. Over the years, uniforms have evolved as new materials and service environment dictate change. For example, in 2010, army units deployed to Afghanistan began wearing uniforms with a new camouflage pattern better suited for concealment in the local environment.

Uniforms typically include all relevant pieces of clothing, including undergarments, socks, hats, badges, insignia, and outerwear. No matter the service, uniforms are to be neat and, by their very nature, uniform. Each garment and accessory imparts information about the wearer's position. Each garment can also dictate appropriate behavior. For example, when in formal dress uniforms, servicemen are not required to salute. However, when in service uniforms, saluting is expected.

Clear standards of behavior are expected when in uniform. For example, personnel who are in uniform are not allowed to engage in public displays of affection, except in very limited circumstances. A serviceman or servicewoman cannot smoke or chew tobacco or be seen at any political gathering in uniform unless on official business.

Responsibility for purchasing and maintaining uniforms varies from branch to branch, but broad similarities do exist. The army issues uniforms to its enlisted ranks and gives servicemen and servicewomen a stipend for their upkeep. Officers must purchase their own uniforms and pay for their upkeep. Each of the other branches of armed services also has the same overall categories of uniforms: physical fitness, combat, service, and dress.

Historical Antecedents

The modern military uniform emerged as part of the development of professional armies in 17th-century Europe. On the most basic level, uniforms served to distinguish friend from foe in an age of warfare,

in which soldiers fought in linear formations on an open battlefield. Uniforms were often colorful and heavily ornamented to signify the power and prestige of the monarch, city-state, or republic. In most armed forces, uniforms invariably signify the hierarchical structures of military organizations, and they traditionally reflect the sharp distinctions between officers and the enlisted ranks. In the case of the military, U.S. Navy uniforms underscore the difference, even in dress uniforms, between officers and the enlisted ranks. For instance, officers wear ties with their formal uniforms, enlisted men a kerchief.

Variation in military uniforms remains the norm, and all the branches of the armed forces have traditionally had distinctive uniforms. During the Revolutionary War, American soldiers wore dozens of different uniform styles that reflected the fact that soldiers were raised and provided to the Continental Army by 13 states. Blue color emerged as the most widely used color in uniforms. For the U.S. Army, it would be the norm through much of the 19th century, and it remains the color of the current dress uniform in most cases. But not all dress uniforms are blue. For instance, cadets at the United States Military Academy wear gray dress uniforms that commemorate an American battlefield victory in which forces led by Winfield Scott wore gray uniforms. Several militia units in New York State patterned their dress uniforms after those worn in West Point.

The 20th century witnessed a striking shift in uniforms worn by soldiers on the battlefield. With the vast expansion of the killing field, concealment remained essential to survival, and uniforms were designed to allow combatants to blend into the terrain. Cotton khaki and olive drab became the norm for soldiers in the army during the two World Wars. During the Cold War, the army service units took on a deeper shade of green to offer camouflage for possible combat in northern Europe and in the jungles of Vietnam.

Army

The army has combat, service, physical fitness, and dress uniforms. The primary utility uniform is the Army Combat Uniform (ACU); however, soldiers have access to others, including those used for maternity wear and for specific jobs, like flight, combat crew, hospital, and food service duties. The Army Service Uniform (ASU) is worn by instructors

at West Point, and soldiers during special events, including funerals. For formal events, army servicemen and servicewomen wear the Mess Uniform, which includes a mess jacket, high-waisted trousers, cummerbund, and bow tie. Army uniforms also include headwear—mandatory for soldiers when out of doors. These range from the Army Patrol Cap, worn with Army Combat Uniforms, to a beret or Service Cap, worn with the Army Service Uniform and Mess uniform.

Air Force

Air force uniforms include the Airman Battle Uniform (ABU), Physical Training Uniforms (PTU) and Improved Physical Training Uniforms (IPTU), Formal Dress Uniform (officers only), Mess Dress Uniform (mandatory for officers, optional for enlisted), Semiformal Dress Uniform (enlisted only), Service Dress Uniform (Class A), and Blue Service Uniform (Class B). Additional uniform pieces include outerwear, service and flight caps, berets, footwear, and underwear. Additionally, air force personnel can utilize Flight Duty Uniforms (FDU), Desert Flight Duty Uniforms (DFDU), Informal Uniforms, and other job-specific uniforms, including equestrian, food service, and others.

Air force personnel must purchase their uniforms from the Army and Air Force Exchange Service Military Clothing Sales Store, supplied by the Defense Supply Center, Philadelphia. Though there are some items that can be purchased from civilian sources (purses, pumps, etc.), many must be bought from authorized manufacturers.

Navy

Historically, a sailor's uniform has been a product of his environment, and the navy believes that a sailor's uniform should not interfere with his work. Sailors have access to a variety of uniforms, including Working Uniforms (camouflage), Coveralls (working uniform at sea), Service Khaki (daily wear), Service Dress Blue, Service Dress White, Dinner Dress Blue, Dinner Dress White, and Summer White. In addition, the navy has specialized uniforms for particular positions or situations, including aviators, band members, maternity clothing, and medical personnel.

Officers are responsible for purchasing and paying for their uniforms. Enlisted service members are

responsible for purchasing their uniforms, but they receive a stipend to assist in paying for them.

Marines

Marines take great pride in their uniforms. A marine dons dress blues only after successfully completing boot camp. Marine uniforms include the Marine Corps Combat Utility Uniform (MCCUU—camouflage), Physical Training Uniform, Service Uniform (green and khaki), and a variety of dress uniforms, including the Blue, Blue-White, Red, and Evening Dress Uniforms.

Marines are prohibited from eating while walking in their uniform. They are instructed to not chew gum, use tobacco, or put their hands in their pockets while in uniform. According to the Marine's code, Marines should be known for their "unparalleled standards of professionalism and uncompromising personal conduct and appearance" as well as for their skills on the battlefield.

UNITED KINGDOM

The United Kingdom of Great Britain and Northern Ireland (Britain) is a close ally of the United States and has participated with it in a number of peacekeeping and combat operations since 1989. Militarily, the United Kingdom is not in the very top tier of world powers, but it possesses well-trained and up-to-date forces that can be effectively deployed far beyond its borders.

The United Kingdom is a chain of islands off the western coast of Europe that constitute one sovereign nation. By far the largest of these, in size and population, is the island of Britain. The United Kingdom's population is about 62 million; its capital is London.

The United Kingdom is a parliamentary monarchy, with a House of Commons elected by universal suffrage and possessing most of the country's legislative power. It also has a part-appointed, part-hereditary House of Lords, and a sovereign, currently Queen Elizabeth II, who symbolizes the nation but has no role in day-to-day politics. The executive consists of a prime minister, usually the head of the largest party in the House of Commons, and a cabinet. The most important cabinet ministers are the foreign secretary and chancellor of the exchequer—equivalent to the U.S. secretaries of state and treasury. Britain's constitution, one of the world's oldest, is revered but "unwritten"—it consists of no single legal document but instead multiple customs and legal precedents that have evolved over centuries. British citizens enjoy the same freedoms, such as speech, press, and religion, as those of the United States. Britain is a member of the European Union (EU), the North Atlantic Treaty Organization (NATO), the Commonwealth of Nations, and numerous other international organizations. It has a permanent seat on the UN Security Council.

Socially, Britain is a welfare state on the European model. Its government provides taxpayer-funded health, education, and other basic necessities to all citizens. Traces remain of Britain's former class system, which consisted of a wealthy nobility, a middle class of shopkeepers and professionals, and a very large working class of manual laborers. The social mix has changed, however, and it is common now to speak of most citizens as Middle Britons, neither rich nor poor.

One reason for this change is the decline of industry. In the 19th century, Britain was the world's greatest producer of industrial goods, and most Britons made their living as industrial workers or farmers. Now it produces relatively few goods and does not need a large manual laboring class. The United Kingdom remains wealthy. Between 1992 and 2008, it enjoyed a long period of economic growth, led by an expansion in the service sector and a vigorous banking and financial sector. Currently, Britain is the world's seventh largest economy with a gross domestic product in excess of \$2 trillion and per capita income of nearly \$35,000.

The United Kingdom.

Source: U.S. Central Intelligence Agency.

History Since 1991

The end of the Cold War in 1991, when the Soviet Union collapsed, removed the fear of Soviet aggression but brought many new military-related

challenges to Britain. Some of these were internal, such as guerrilla warfare in Northern Ireland and terrorism associated with increasing immigration. Some involved deployment of Britain's defense

forces overseas to deal with international terrorism or violent regimes.

Britain was for centuries a great military power. It no longer has that status, but its defense forces are modern and formidable, including an independent nuclear capability. All defense forces are under civilian control through the Ministry of Defense. The military has no role, official or unofficial, in politics. The military enjoys the esteem of the British population, although Britain possesses strong antiwar and pacifist organizations, such as the Campaign for Nuclear Disarmament. Britain's involvement in the invasion and occupation of Iraq from 2003 to 2009 was unpopular, but the onus for it was placed on the government, not the military.

The United Kingdom's military is entirely volunteer and professional. It numbers about 180,000 active personnel with a regular and volunteer reserve of about 240,000. Total spending on the military

is about 2.5% of gross domestic product—in 2012 about \$60.8 billion. That compares with U.S. military spending of about 4.4% of gross domestic product, and fiscal year 2010 U.S. spending of \$663.8 billion.

Britain deploys a number of sophisticated weapons systems. The United Kingdom's nuclear force utilizes U.S. delivery systems—four *Vanguard*-class nuclear submarines, each with 16 Trident II submarine-launched ballistic missiles, each of which carries up to three independently targeted warheads. Britain's stock of operational nuclear warheads is thought to be about 160, her total stock including nonoperational warheads about 225. The exact number is classified. The Royal Air Force deploys the Tornado GR4 attack plane, armed with cruise missiles, laser- and GPS-guided bombs, and other weaponry; the Eurofighter Typhoon F2 multi-role/air superiority fighter; and the Boeing C-17

A UK Royal Air Force GR4 Tornado aircraft returns to mission on June 3, 2011, above Afghanistan in support of Operation Enduring Freedom.

Source: U.S. Air Force photo by Master Sergeant William Greer.

Globemaster heavy transport. Its helicopter fleet is modern in both transport and fighting capability. Some of its air fleet, such as Chinook helicopters and the C-17, are American-made.

The Royal Navy is likewise capable of projecting force. Its large warships number 7 destroyers; 7 submarines not counting the 4 nuclear-armed *Vanguard* class; and 17 frigates. Each of these numbers is projected to decrease in the next few years. Britain had had no operational aircraft carriers since 2011, but is building two large aircraft carriers of the new *Queen Elizabeth* class, expected to go into service between 2014 and 2016. Fixed-wing aircraft for them will not be available until 2020, and they will not be fully operational until then. The Royal Navy also has patrol ships and amphibious landing capability.

The British army deploys a variety of armored and patrol vehicles and self-propelled artillery. The Challenger II, in service since 1994, is the main

battle tank, and the AS90 155-mm self-propelled gun the primary heavy artillery piece. Infantry weapons range from assault rifles to 81-mm mortars to shoulder-fired antitank weapons.

The United Kingdom also possesses excellent special forces capable of small-group tactical and intelligence missions. The best known of these are the Special Air Service and Special Boat Service.

Since 1989, Britain's military has engaged in combat or peacekeeping missions in Cyprus, Bosnia, Kosovo, Iraq, Northern Ireland, Sierra Leone, Afghanistan, and Libya and has manned bases in British territory around the globe. Most of these deployments have been in concert with the United States.

Two notable exceptions are Sierra Leone and Northern Ireland. In 2000, British troops intervened in a bloody civil war in Sierra Leone, a former colony. They quickly defeated rebels of the Revolutionary

Source: Department of Defense photo by Sergeant Gustavo Olgiati, U.S. Army.

United Front and restored peace. Sierra Leoneans were grateful, and the then prime minister Tony Blair, who ordered the operation, is seen by many in Sierra Leone as a hero.

Northern Ireland operations did not go as well. Between 1969 and 1998, Northern Ireland endured a guerrilla war, known as The Troubles. Most of the fighting was between pro-British, "Unionist" Protestant paramilitaries, and Catholic paramilitaries of the Irish Republican Army, or "Nationalists," who wanted Northern Ireland to become part of the Irish Republic. The war featured bombings and assassinations rather than battles, and the Irish Republican Army frequently carried its bombing campaign into the rest of Britain. In all, 3,526 people, mostly civilians, died in The Troubles. The British army engaged in peacekeeping operations in Northern Ireland for nearly three decades with little success, amid scandals over allegations of torture and a failure to quell the violence.

Fighting was ended by the Good Friday Agreement of April 10, 1998, brokered in part by the then U.S. president Bill Clinton and his special envoy, former U.S. senator George Mitchell. There have been some incidents since 1998, and tensions between Catholics and Protestants remain high, but the peace has held. Northern Ireland is today considered a model for peacemaking between rival ethnic and religious groups.

Britain was involved in two operations in the Balkans. In 1995, British, U.S., and other NATO forces intervened to halt massacres of civilians, mostly by ethnic Serbs, in Bosnia. They did the same in Kosovo in 1999, to halt the ethnic cleansing of Muslim Kosovars by Serbs. This operation consisted of an aerial bombing campaign, followed by an occupation of Kosovo. No ground combat was necessary.

In 1991, Britain provided the third largest contingent of troops participating in coalition forces in the Gulf War in Iraq. The purpose of the operation was to defeat Saddam Hussein's Iraqi forces, which had invaded the Persian Gulf nation of Kuwait. The U.S.-led and UN sanctioned coalition liberated Kuwait.

Public opinion quickly turned against Britain's participation in the 2003 invasion of Iraq. Allegations were made that the invasion was based on faulty or falsified intelligence. The death toll for UK soldiers during the subsequent occupation, at 179, was much lower than for the United States but was seen by the British public as insupportably

large. The Iraq War eroded the popularity of Blair, who was accused of deception and of being too willing to cooperate with the U.S. president George W. Bush. Blair resigned in 2007, and British combat forces were withdrawn from Iraq in 2009.

The United Kingdom also participated in the 2001 invasion of Afghanistan and still has troops there. This war is also unpopular, according to opinion polls, but has not become a major political issue. Finally, Britain took a leading role in the UN-sponsored and NATO-led air operation that led to the overthrow of the Libyan dictator Muammar Qaddafi in 2011.

Britain's closest ally is the United States because of their shared history and values. This closeness, sometimes called the "special relationship," extends to military matters. The British military cooperates closely with the United States in training and operations and permits the U.S. Air Force to maintain bases in the United Kingdom, as well as a naval base at Diego Garcia in the Indian Ocean, part of the British Indian Ocean Territory.

Britain is also a member of the EU. Although EU-U.S. relations are friendly, interests of the two sometimes conflict on matters such as trade and strategic policy. This means that the United Kingdom must engage in a difficult balancing act. However, its "Mid-Atlantic" position is also seen by many thoughtful Britons as providing an opportunity to mediate between the two, speaking to each as a friend. By doing so, Britain can maximize its influence on each party, while maintaining freedom to pursue its own interests. This rosy scenario has been called into question by recent tensions between Britain and other EU members, which could result in a renegotiation of Britain's terms of EU membership or, in the most extreme case, a withdrawal from the EU.

Future Prospects

The United Kingdom, like most of Europe, faces grim challenges in the next decade. The core of its difficulty is economic: Despite the long period of prosperity from 1992 to 2008, the national debt is high, the cost of pensions and medical services for an aging population is projected to be ruinously large, and the political consensus for expensive welfare state measures has eroded. These structural difficulties have been exacerbated by the post-2008/2009 "Great Recession" and the extremely slow recovery from it.

In response, the administration of the Conservative prime minister David Cameron has embarked on an austerity program, cutting all government spending significantly. In October 2010, Cameron announced an 8% reduction in the military budget. This included a reduction of 17,000 active military personnel, the early mothballing of the aircraft carrier *Ark Royal* and its Harrier jump jets, the reduction in the number of other major warships from 32 to 19, and cuts in proposed new weaponry. These cuts may affect its readiness and willingness to engage in military missions outside its borders and its ability to modernize its forces.

Nevertheless, Britain still has territory and interests around the world that must be defended. The threat of terrorism places a premium on military intelligence and rapid-response capability. Britain has responsibilities as a member of NATO. And, the British people value their connection with the United States, including the military connection.

For these reasons, a more drastic drawdown of British forces is unlikely, barring a serious worsening of the economic situation. Public opinion would not stand for British soldiers and pilots being put at risk due to inferior equipment or training. Britain's military is not large, but it is one of the best equipped and most operationally competent in the world and is likely to remain so.

UNITED NATIONS

The United Nations system has undergone myriad changes from the moment of its inception to the present. The most significant of these changes occurred after the end of the Cold War, which saw the organization move from a period of near paralysis to one of decided activism. Nowhere is this shift more evident than in the conduct of peacekeeping operations (PKOs), which were decidedly weaker during the Cold War as the two superpowers avoided encroaching on each other's spheres of influence. This stalemate would be broken in the early post-Cold War era with PKOs in Cambodia, Somalia, and the former Yugoslav Republic.

As of August 2012, the United Nations maintained 15 peacekeeping missions and a special political mission to Afghanistan. The United Nations staffed these operations with 80,000 military personnel, contributed by 115 different countries. These operations in fiscal year 2012–2013 were budgeted to cost more than \$7 billion.

Organization of the United Nations

The United Nations Organization has its roots in the Atlantic Charter of August 1941 issued by President Franklin D. Roosevelt and British prime minister Winston Churchill, which was drafted in a desire to create an effective international body that would not suffer the fate of the failed League of Nations. After the United States entered World War II, Roosevelt coined the term *United Nations* for the wartime alliance fighting Nazi Germany and Imperial Japan. It was not until the discussions at Dumbarton Oaks in Washington, D.C., during September and October 1944, however, that a formal organization for the United Nations was set out and the functions of three of its main organs, the Security Council, the General Assembly, and the Secretariat, articulated. Of particular importance in the discussions at Dumbarton Oaks was a disagreement over a veto power in the

Security Council, which would be resolved at the Yalta Conference in 1945 by assigning veto power to the five permanent members of that body (the United States, Great Britain, France, the USSR, and China). The veto would come to play an important role in the Security Council's peacekeeping efforts as the Cold War unfolded because it rendered any bold action by the council futile in the face of opposition of one superpower or the other.

The final treaty establishing the United Nations was negotiated in San Francisco in June 1945, and this treaty had a sufficient number of nations ratify it for it to take effect in October 1945. The first meeting of the UN General Assembly took place in London, but New York City would become the permanent headquarters of the organization. The charter proclaims the need to save succeeding generations from the scourge of war by the maintenance of peace and the prevention of war. The UN system was organized into six main bodies: To the three mentioned above, the Economic and Social Council, the International Court of Justice, and the Trusteeship Council were added. In addition to these, there exist a series of specialized agencies, many of which also aid in international peace and security.

Role of the Security Council and Secretaries-General in Peace and Security

The Security Council is the principal organ of the United Nations vested with responsibility for overseeing the maintenance of international peace and security. All international conflicts, as stated in the charter, are referred to it for peaceable resolution. The Security Council today consists of 15 member states (5 permanent and 10 rotating). The five permanent members, or P5, are the United States, Great Britain, France, China, and Russia; all five possess veto power over Security Council action. Among the most important provisions of the charter pertaining to the Security Council are Chapters VI and VII. The former confers the responsibility of overseeing the pacific settlement of disputes on the council, while the latter grants the council the power to apply economic sanctions or even to direct military operations with troops volunteered by member states for the purpose of restoring peace.

The efforts of the UN secretaries-general have been of significance in the UN's preservation of

international peace and security. The office of the secretary-general is a relatively weak position as stated in the charter. All references in Chapter XV to the office are vague and entail oversight, maintenance, and the like, rather than being clear articulations of the powers of the office, like those of a president. In addition, the office has no real authority over nation-states, such that anything the secretary-general says must remain a recommendation. As a result, contributions by the secretary-general in the area of international peace and security have depended largely on the personal initiative of the individuals occupying the office. In this sense, the office can be divided into three types of secretaries-general: (1) those who designed and expanded the office; (2) those who consolidated it; and (3) those who have attempted to reform it.

In the camp of the designers was Dag Hammarskjöld from Sweden, who promoted the concept of mission diplomacy and did much to expand the office. Mission diplomacy consisted of two components: (1) quiet diplomacy and (2) preventive diplomacy. The latter of these involved peacekeeping operations, which Hammarskjöld defined broadly as serving to prevent conflict, making the secretary-general an independent office rather than just an instrument or agent of the United Nations. This type of PKO, widely considered as one of the first Chapter VI^{3/4} operations, had its largest manifestation with the UN Operation in the Congo (*Opération des Nations Unies au Congo*, or ONUC).

Among the consolidators was Kurt Waldheim of Austria, who took office in 1972 at a time when the United Nations was in notable decline and the USSR was expanding its sphere of influence and challenging U.S. power. This was the height of Cold War—prompted UN inactivity. Waldheim's stewardship of the UN is significant because it was nonintrusive. Rather than pursuing resolutions to conflicts proactively, he waited for the parties to a dispute to come to him. His idea of conflict resolution was finding a common ground. UN peacekeeping went dormant from 1972 to 1981, while Waldheim was secretary-general, and was invigorated only after the end of the Cold War.

Finally, the group of reformers includes the Peruvian Javier Pérez de Cuéllar, the Egyptian Boutros Boutros-Ghali, and the Ghanaian Kofi Annan. Pérez de Cuéllar inherited a United Nations in financial crisis in 1981, facing conflicts around

a globe that had not seen a PKO in 3 years. Under his command, the United Nations undertook operations in Afghanistan, Angola, and Nicaragua, the last of which consisted of election monitors who successfully oversaw the exit of the Sandinistas and the entrance of Violeta Chamorro, the U.S.-endorsed candidate. Much of Pérez de Cuéllar's success was due to the end of the Cold War and a declining Soviet Union, which restored faith in PKOs and encouraged those who would follow him.

Boutros Boutros-Ghali is notable for having presided over a 1992 Security Council summit meeting at which he was asked for a plan outlining his recommendations for peacekeeping in a post-Cold War world. His answer, a booklet titled *An Agenda for Peace*, advocated preventive diplomacy, armed peacekeeping, and postconflict nation-building. His belief was that the secretary-general should handle peace enforcement without General Assembly or Security Council authorization. In addition to this, he wanted a UN rapid reaction force, all positions that portended a new era in peacekeeping.

Kofi Annan also produced a reform document, titled *Renewing the United Nations: A Programme for Reform*. In it, he set forth a series of recommendations to reinvigorate the United Nations; he also supported a rapid reaction military force, a UN military corps to lead PKOs, an office of special representative for PKOs, and nation-building. As this makes clear, the Security Council and secretaries-general have been the principal forces in peacekeeping and its reform, but there are other bodies involved in this function of the United Nations.

The General Assembly, the Economic and Social Council, and the Specialized Agencies

From the first days of the United Nations, other organs and specialized agencies within the organization have played a minor—but no less important—role in its maintenance of international peace. To begin with, the General Assembly, especially during the years of inactivity of the Cold War, provided a sort of escape valve for operations that may have been blocked by the superpowers. According to Article 10 of the charter, the General Assembly may discuss or make recommendations on any matter relating to the charter and the maintenance of international peace and security, a provision limited only by Article 12, which limits this to matters that are

not being considered at that moment by the Security Council. This gives the General Assembly much power in the realm of peacekeeping as it is able to circumvent the Security Council veto, a particularly important point during the Cold War. In fact, this allowed the General Assembly to oversee the Korean War in the 1950s.

The UN Economic and Social Council is significant because, as set forth in Chapter X of the charter, it works in unison with the General Assembly and various specialized agencies of the United Nations to make recommendations on matters of an economic and social nature, in addition to issues relating to education, health, and culture. The recommendations it makes may seek to promote or protect human rights and civil freedoms across the world, and it can call international conferences on these matters or any other within its purview.

Connected in many ways to the Economic and Social Council—and reporting to it—are the various specialized agencies within the United Nations, which include the World Bank, the Food and Agricultural Organization, United Nations Educational, Scientific and Cultural Organization, and a number of others that promote economic development, human rights, public health, and myriad other matters. The World Health Organization, located in Geneva, deals with immigration, nutrition, family planning, immunization, and disease control. It has a very broad agenda that in some cases can touch on issues important to the maintenance of international peace. The World Health Organization has had many successes in establishing benchmarks and solving pressing problems, often with the simplest of responses. Among its greatest successes is its campaign to eradicate smallpox and its efforts to eliminate polio. The Food and Agricultural Organization seeks to raise the levels of nutrition and food production around the world. Like the World Health Organization, the Food and Agricultural Organization also has a broad agenda and often deals with corruption and a number of other issues that ultimately relate to peace and security.

Peacekeeping During the Cold War

Peacekeeping during the Cold War was rather muted. As noted, superpower disagreement in the Security Council led to frequent use of veto power to prevent either side from encroaching on the other's

sphere of influence. Some of the defining characteristics of this traditional form of peacekeeping involved the consent and cooperation of the parties to the dispute, the impartiality of the organization, the exclusively defensive use of force, a limitation to interstate conflicts, and application only to areas outside of the superpowers' spheres. This type of operation sought to freeze the situation rather than to resolve it.

An example of a classic Cold War PKO was the operation in Cyprus. Clashes on the island divided between a majority Greek and minority Turkish population broke out soon after independence. As a result, the UN Force in Cyprus was authorized. Following a Turkish invasion in 1974 and claims of an independent Turkish Cyprus in the northern part of the island, the UN Force in Cyprus was expanded to create a buffer line from one end of the island to the other. The operation initially had a 6-month mandate but stayed in place indefinitely. This was the case because it was popular and no one was threatened by it. In addition, it was within the North Atlantic Treaty Organization (NATO) sphere—both Greece and Turkey were member states. Finally, no war has broken out since the buffer force has been in place. This was a typical, unthreatening Cold War PKO. Among the problems with this approach is that the problem is never resolved among the parties.

Post-Cold War Peacekeeping

The first instance of international organization following the Cold War proved to be a resounding success. The coalition built to repel Saddam Hussein's Iraq from Kuwait gave the United Nations confidence that international cooperation could finally flourish. At the time of Iraq's invasion of Kuwait in August 1990, many questions still surrounded the possibility of collective security, the role of the United Nations as the hub of such coordination, and the willingness of the moribund—but still existent—Soviet Union to accept Western intervention in the Gulf. It was clear that a truly global coalition would be required and—individual state interests notwithstanding—the United Nations provided the perfect justification for such a coalition. States could claim to be acting to protect the integrity of Article 2(4), general repudiation of war contained in the UN Charter, violated flagrantly by Saddam Hussein. The coalition could also justify its campaign against Iraq through a Security Council authorization of force.

This use of the United Nations invigorated the organization and set the stage for the operations of the early 1990s.

The experience of the Persian Gulf War ushered in an era of unprecedented activity and optimism for the organization. During the 1990s alone, more PKOs were undertaken by the United Nations than in the preceding five decades of the organization's existence combined. Weak operations designed to avoid the veto of either superpower were a relic of the Cold War past, and the demise of competing spheres of influence meant an increase of potential areas of operation. In addition to these, a number of changes within the organization, such as the arrival of an ambitious and optimistic secretary-general, also contributed to this confidence.

This optimistic environment also bred a more aggressive type of peacekeeping. During the Cold War, PKOs were limited to humanitarian assistance, buffer forces, and other activities that could take place preceding or following a full-blown conflict. These types of first-generation operations are commonly referred to as Chapter VI½ operations, in reference to the part of the UN Charter authorizing the United Nations to mediate conflicts, as well restore peace and international security. Chapter VI of the charter deals with the pacific settlement of disputes. Since traditional Cold War operations went slightly beyond this, the qualifying fraction was added. First-generation peacekeeping is thus predicated on the absence of ongoing conflict during the UN presence in an area, an assumption of UN neutrality and the assent of all parties to UN presence. Chapter VII, instead, deals with the Security Council's war authorization power, and the Gulf War falls under this category.

Second-generation peacekeeping, accordingly referred to as Chapter VI¾ operations, was a product of the reinvigoration of the United Nations due to this post-Cold War euphoria. This bolder type of PKO is characterized by the ongoing nature of the conflict when the United Nations enters the area and lacks the assent of one or all parties to its presence. Three definitive PKOs of the 1990s fall under this rubric of second-generation peacekeeping, and their disastrous consequences would put a decisive end to the aura of optimism surrounding the United Nations in the early 1990s. They would, in addition, serve to sour American perceptions of the organization and its possibilities.

Cambodia

The first of these operations took place in the war-ravaged region of Indochina. The U.S. policy in the early 1970s of combating Viet Cong strongholds in Cambodia pushed that country's Maoist rebels to the interior, away from the U.S. war with Vietnam. This group, known as the Khmer Rouge, was eventually able to assume control of Cambodia and what ensued over the next half decade was the extermination of almost a third of the country's total population. This was followed by a Vietnamese puppet regime in Cambodia, which was sustained as long as the Cold War went on. Once Soviet support ran dry, however, Vietnam found its presence in Cambodia untenable. At that point, the United Nations became involved in the country to avoid a potential return of the Khmer Rouge.

The optimism of the times was evident in some of the UN goals for Cambodia, set forth in the 1991 Paris Accords, which included the demobilization of armies, the return of refugees, and elections within 18 months. This bold PKO would enter on Vietnamese withdrawal and run the country until a provisional government could replace it. From the outset, however, the UN Transition Authority in Cambodia suffered crippling problems, including a general lack of support from the major actors, a lack of democratic traditions in Cambodia making nation-building nearly impossible, and an unrealistic time frame in which to achieve such lofty goals. In the end, UN Transition Authority in Cambodia oversaw the election of a new government in 1993 that was overthrown almost immediately after the UN departure. The first optimistic post-Cold War PKO proved to be a failure.

Somalia

Chapter VI^{3/4} peacekeeping, however, did not end with the failure of the UN Transition Authority in Cambodia. The next instance of overly optimistic peacekeeping took place in Somalia, another object of superpower interest during the Cold War. Before the demise of the Soviet Union, each of the two superpowers poured funding and arms into the east African nation as its evolving ideological affiliation dictated. This superpower interference fostered a dictatorial form of government that collapsed once the country was left to fend for itself and contributed to a severe weapon saturation, which would

fuel the conflict to come. The country descended into civil war and reverted to an organic tribal structure, which led to humanitarian disaster. Starvation was rampant, and clan rivalries allowed food supply lines to reach only certain sectors.

The United Nations set up a traditional PKO to deal with food distribution issues. When this proved insufficient due to a general lack of cooperation on the part of the rebels, it was decided that a second-generation operation would be necessary and the UN Operation in Somalia (UNOSOM I) was established in 1992. UN Operation in Somalia's goal was humanitarian in nature, namely getting food to the areas in which it was needed, but in this effort, a number of peacekeepers were targeted, shocking the world and leading the United Nations to respond by expanding the operation's mandate to fix the underlying problems in the country. UN Operation in Somalia II was initially led by U.S. forces, but when 18 U.S. soldiers were massacred outside of a hotel in Mogadishu, the United States pulled out, an incident that likely led to future American aversion to peacekeeping and a rather bitter relationship between the United States and the United Nations. Further exacerbating the problem, President Bill Clinton placed the blame for the incident squarely on the United Nations. This deterioration of U.S.-UN relations would have disastrous consequences for future international crises, most notably Rwanda where the UN peacekeeping force lacked sufficient strength to halt a genocide of an estimated 800,000 people.

Bosnia

The Yugoslav case was a particularly difficult one due to the diverse ethnic and religious groups forced together in a new nation in the aftermath of World War I after the collapse of the Austro-Hungarian Empire. Notwithstanding these issues, the country held together during the Cold War under Marshal Tito, but on his death, it began to unravel. Belgrade, the center of the Serbian republic and the traditional capital of Yugoslavia, began to overwhelm the other republics. Lacking the pan-Slavic nationalism that prevailed under Tito, the republics began to break away in 1991, beginning with Slovenia and continuing with Croatia.

In response to Croatia's war of independence, the UN Protection Force (UNPROFOR) was established, consisting of a buffer line meant to keep the

actors separated. Additionally, an arms embargo was established, which had the undesired effect of freezing Belgrade's military advantage in place. In 1992, Bosnia declared its independence, and Belgrade began to bombard the nation's capital, Sarajevo. The United Nations responded to this outbreak with sanctions, recognition of Bosnia as an independent country, and an expansion of UNPROFOR. The first two of these responses prompted Belgrade to leave, but this tactical move caused the conflict to revert back to a civil war and left Bosnia in the hands of the Bosnian Serbs.

The conflict continued, and UNPROFOR was once again expanded. Until then, bitter experiences with nation-building had kept the United States out of Bosnia, but once an agreement was reached by all sides, the United States entered in 1994. Although all sides seemed to be in agreement, Bosnian Serbs severed themselves from Belgrade and continued the war. Peacekeepers were being targeted, and thus, NATO was given authorization to conduct airstrikes in order to stop the war. Bosnian Serbs responded to that with a number of massacres, including the horrific genocide at Srebrenica. This event, however, also represents a turning point in the war, a Bosnian-Croat alliance that was able to push the Serbs far enough out of Croatia and Bosnia for a U.S.-led bombing campaign to take place, bringing an end to the war.

The Bosnian experience left a poor impression of the United Nations and its utility. At the same time, the conflict was poorly handled by a bureaucracy ill-equipped to deal with an operation of the magnitude of UNPROFOR; the United Nations doggedly clung to a settlement where one was impossible, and the organization's forces suffered from a complete lack of respect on the ground. Although a number of U.S. allies including Canada, Great Britain, and France contributed troops to UNPROFOR, no American ground troops served in this operation. Bosnia proved to be the final assault on the post-Cold War optimism that had flooded the halls of the UN headquarters only half a decade earlier, and it would condition the way in which the United States would deal with perceived threats in the future.

Although the Cold War led to collapse of the Soviet Union, old Cold War loyalties proved difficult for both sides to shed. For instance, when Serbia's government engaged in ethnic cleansing in Kosovo in 1999, Russia refused to support a Security Council

resolution authorizing the use of force. Instead, the United States, Great Britain, France, Canada, and other Western nations relied on NATO to wage an air campaign against the Serbian regime of Slobodan Milosevic. China is often reluctant to support resolutions that can result in regime change. For instance, China and Russia have blocked efforts for the United Nations to intervene more forcefully in Syria in 2013.

Future of Peacekeeping

A little more than a decade after the Persian Gulf War—in which the United Nations had proven its instrumentality in building a coalition against Iraq—the United States and the United Nations once again found themselves on the threshold of conflict with Saddam Hussein's regime. This time, however, opposition, especially by France and Germany, on the UN Security Council meant the United States would not fight against Iraq with the blessing of the United Nations. Although the United States created a coalition to launch a successful effort toppling Saddam Hussein's regime, U.S. credibility was diminished. In debates leading up to the Iraq War, the U.S. secretary of state Colin Powell insisted that there was incontrovertible evidence that Iraq had weapons of mass destruction and challenged reports from UN weapons inspectors to the contrary. Despite years of looking for weapons of mass destruction, U.S. forces never found any. Moreover, the U.S. preparations for the occupation of Iraq proved inadequate, and an insurgency quickly emerged. After the fall of Saddam, the United Nations sent a team to aid American efforts to rebuild Iraq, but virtually the entire UN presence was withdrawn after their compound was destroyed by a truck bomb. Among those killed were Sérgio Vieira de Mello, whom many expected to eventually become UN secretary general.

President Barack Obama and his first secretary of state Hillary Clinton embraced a foreign policy rhetorically supporting the efforts of United Nations to promote peace. The United Nations provided official sanction to U.S. and NATO efforts against Libya in 2011. The United States, the United Kingdom, and other allies have sought to bolster international support against the Syrian regime of Bashar Hafez al-Assad. While the heady optimism of the early 1990s regarding the capability of the United Nations in forging a new world order has passed,

this organization continues to play an important role in international affairs and maintains stability in Haiti, Africa, the Middle East, and Asia.

UNITED TECHNOLOGIES CORPORATION

United Technologies Corporation is an international conglomerate that oversees a number of subsidiary companies. It is a major manufacturer of defense technologies, including missile systems and military helicopters. The most famous of the latter is the UN-60 Black Hawk. This entry will provide a brief overview of the corporation's history and present its current role in the American defense industry.

Early Years

The company began in 1925, when Fred Rentschler founded the Pratt & Whitney Aircraft Company. The company served as one of the first to specialize in manufacture of engines specifically designed for aircraft builders. In its early years, the chief customers of Pratt & Whitney were Bill Boeing and Chance Vought. As the decade wore on, Rentschler sought a means to formalize his relationship with the other two aircraft producers.

Rentschler's quest bore fruit in 1929. In that year, the core of what would become United Technologies formed under the name United Aircraft and Transport Corporation. This corporation formed from several constituent elements, including Boeing Airplane Company, Boeing Air Transport, Chance Vought, Hamilton Standard, Pratt & Whitney, and Sikorsky, all major aviation producers in their own right at the time. This conglomerate proved short lived, however, as it was forced to break up due to the Air Mail Act of 1934. Three new corporations subsequently formed out of the elements of the old group. These included Boeing Airplane Company and United Airline Transport. The company's manufacturing interests east of the Mississippi became United Aircraft Corporation.

World War II

The Second World War stimulated production and growth in a number of industries, and United Aircraft was no exception. During the war, the corporation and its various components served as a major contractor to the U.S. government, supplying crucial aerial technology to the Allied war effort. By 1945, roughly half of all U.S. service planes were powered by the company's Pratt & Whitney engines. In actual numbers, this equaled 363,614 engines. Likewise, Sikorsky supplied the U.S. government with 150 helicopters in the later phases of the conflict. Finally, during the period ranging from 1940 to 1945, Hamilton Standard and its subsidiaries produced some 500,000 propellers.

Cold War

With the end of World War II and the emergence of the Cold War, United Aircraft sought to maintain its position as an important government contractor. To this end, the company began to experiment with

jet engines, with Pratt & Whitney producing their first models in 1948. Likewise, the Sikorsky division stood among the first to experiment with the new technology of helicopters. These experiments bore fruit in 1957 with their introduction of the first turbine-powered helicopter. One major obstacle arose for United Aircraft in 1954, when the company had to dissolve its partnership with Chance Vought due to conflicts of interest.

Still, the company maintained a leading role in both military and commercial aviation. United Aircraft and its various subsidiaries began to diversify into consumer appliances and electronics through various acquisitions but never sacrificed its commitment to national defense, especially in the realm of aeronautics. This commitment manifested in 1974 when the company provided the F100 engine for the first generation of F-15 fighters.

United Aircraft sustained its focus on the aerospace industry until 1975. In that year, the company purchased Otis Elevator and changed its name to United Technologies. The acquisition of Otis marked a significant shift in the company's direction, as it began to focus greater attention on the consumer sector. This trend continued in 1983, when United Technologies acquired Carrier Corporation, an air conditioner manufacturer. Still, the military aviation aspects of the company, which had played such an important role in its growth and development, were not neglected. United Technologies supplied the first Black Hawk helicopter to the U.S. Army in 1978.

Post–Cold War

With the collapse of the Soviet Union and its satellites in eastern Europe in the late 1980s and early 1990s, the defense industry underwent significant upheaval. In 1991, several of the companies under the United Technologies umbrella, including Carrier, Otis, and Pratt & Whitney, posted losses. United Technologies successfully adjusted to the new business environment of the post–Cold War economy. Currently, it includes the following corporations under its umbrella: Carrier Heating and Air Conditioning, Hamilton Sundstrand aerospace and industrial system, Otis, Pratt & Whitney, Sikorsky (helicopters), UTC Fire and Security (a fire safety and security products and service corporation), and UTC Power (a supplier of fuel cells and power systems).

United Technologies Corporation and its subsidiary companies have likewise played a significant role in the U.S. defense industry in the post–Cold

War environment. Their Black Hawk helicopters made a significant contribution to the defeat of Iraq in the Persian Gulf War of 1990–1991 and have continued to figure prominently in successive military operations.

The commitment of United Technologies to the defense aviation industry shows little sign of diminishing in the near future. In 2004, for instance, United Technologies Corporation acquired the Schweizer Aircraft Corporation to serve as a wholly owned subsidiary of the Sikorsky Aircraft division. In 2007, the company opened a Rapid Prototyping and Military Derivatives Center near Big Flats, New York.

Conclusion

Since its founding in 1929, United Technologies Corporation in its various manifestations has played an important role in providing aviation defense for the United States. While it has become a significant entity in various consumer industries as well, it retains its commitment to national defense.

UNMANNED AERIAL VEHICLES

An unmanned aerial vehicle (UAV), commonly known as a “drone,” is an aircraft with no pilot on board, remotely controlled from the ground and/or flying in part autonomously (preprogrammed or navigated by automation systems). Currently, various types of UAVs of different shapes, sizes, characteristics, and capabilities are used by the U.S. military for diverse missions: from intelligence, surveillance, and reconnaissance to attack. Their applications have been largely multiplied by the

technological innovations introduced since the early 1990s. During the recent conflicts in Afghanistan and Iraq, the heavy use of UAVs has been such an exceptional feature that the future of air power is increasingly seen as belonging to the drones.

Historical Background

The modern record of pilotless systems begins with a British project aimed at remotely controlling an aircraft: “aerial target,” developed in 1916 by the “father of radio guidance systems,” Archibald Montgomery Low. During World War II, the Germans, outnumbered by the Allies, sought to develop unmanned weapons, such as Fritz (a bomb with wings and engine, jettisoned from a plane and remotely radio-targeted). However, until the late 1950s, UAVs were not aircraft but merely the prototypes of guided weapons. Only in 1960 did the United States initiate its first truly unmanned reconnaissance project, the “Red Wagon.” Although quickly cancelled, it catalyzed the development of the Fire Fly drone (renamed Lightning Bug in 1963)

deployed during the Vietnam War. At the height of UAVs’ utilization in Indochina, they made up to 40 reconnaissance flights per month (3,435 missions in total). The next attempt to accelerate the unmanned revolution came in 1979, when the army launched its “Aquila” program (canceled in 1987 due to rising costs and technological obstacles).

UAVs were used for the first time on a larger and more systematic scale during the Persian Gulf War (1990–1991). Pioneer, the Israeli-designed unmanned spy plane armed with guns, went through a baptism by fire during the war. The coalition forces used 40 Pioneers, which flew almost 1,700 hours in more than 500 reconnaissance sorties. On one occasion, an Iraqi unit surrendered to the drone—a first, historic event of men giving up to a robot. Although UAVs proved exceptionally useful and continued to work in most U.S. operations, including Somalia, Haiti, Bosnia, and Kosovo, their performance was still limited. To overcome these shortcomings, the United States has made huge R&D investments that have allowed for a massive deployment of drones since 9/11.

Prominent Drones in Service

Although there are dozens of types of UAVs in the U.S. inventory, some are emblematic. Predator, the most famous model, was the first high-tech remotely operated U.S. drone to prove its effectiveness in war. It went into service in 1994 and was soon used for reconnaissance in Bosnia during 1996 and 1997 and in Kosovo in 1999. With an endurance of 27 hours, equipped with video cameras for both day and night vision, Predator sends real-time video streaming to ground command centers. It carries synthetic-aperture radar, which enables reception through clouds, smoke, and dust. The first generation of Predator had some limitations resulting from weather conditions (in Kosovo it could be used for only 24 days during the 78-day North Atlantic Treaty Organization campaign). After 9/11, Predator was armed with laser-guided Hellfire missiles and began regular combat missions first in Afghanistan and later Iraq. Global Hawk, introduced as a pilotless replacement of the famous Cold War era U-2 plane, is a high-altitude spying drone.

It also made its debut during the Balkan wars, collecting information on Serb troops, air defense systems, and refugee flows. The special feature of another UAV—the Reaper, in use since 2008—is the “automatic man-made object detection” software that distinguishes between humans and human-made objects. Raven is a small drone used by the U.S. Army and Marine Corps and launched by hand. Its low endurance of 1.5 hours suffices for “around the corner” missions (e.g., sending images from the other side of a hill or building). Because it gives ground units their own life-saving capabilities, demand for the Raven has been expanding dramatically, especially in Iraq between 2003 and 2005 (the number of Ravens in use by the U.S. military grew from 25 to 1,300, with 2,000 more on contract). GT Max is a pilotless helicopter that, being able to learn in-flight, has some rudimentary artificial intelligence capabilities. It can not only fly on its own but also autonomously avoid obstacles. X-45 represents the next generation of self-controlled and automated drone with the human factor reduced

Note: This Reaper is assigned to the 46th Expeditionary Reconnaissance and Attack Squadron from Creech Air Force Base, Nevada.

simply to programming the flight track and mission details. Designed for the most dangerous missions, X-45 will be replacing manned bombers and fighters.

Applications

Over the past two decades, the roles played by UAVs have proliferated. Most commonly, they are used for intelligence, surveillance, and reconnaissance missions to gather image and video data transmitted via satellite communications in real-time back to ground sites both in the United States and the area of operation. Next, the operators send the information via e-mail or radio (if required, they can also transmit streaming video) to the commanders, flight coordinators, intelligence units, and troops on the front line. Thus, UAVs conduct terrain reconnaissance, observe enemy forces and follow their movements, monitor hostile infrastructure, identify targets, and carry out battle damage assessments. A long-endurance drone can—similarly to closed-circuit TV cameras—provide an overall picture of how things develop over time. Microdrones, including the ones that can fly into buildings or monitor them from the outside, are perfect for spying, as they are hardly noticeable and can work nonstop for long hours. For these reasons, in the future UAVs may be of special importance in urban warfare. Because drones can fly slower and at lower altitudes than manned aircraft, they provide better reconnaissance, which helps reduce the risk of friendly fire. Moreover, by laser-pointing targets, drones add to the precision of air and ground strikes. In addition, UAVs have found application in homeland security: They conduct surveillance over the U.S.-Mexico border, helping seize illegal immigrants and narcotics.

Equipped with sophisticated ultra-sensitive sensors, unmanned platforms can find hidden enemies by tracking an electromagnetic field or body heat. Furthermore, UAVs are used in search and rescue missions to find survivors both on the battlefield and in the aftermath of natural disasters (e.g., the Silver Fox UAV after Hurricane Katrina). When loaded with special sensors, drones can detect biological, chemical, or radiological weapons and contamination. In addition, UAVs can perform logistic missions delivering cargo, such as medical emergency kits, when sending a manned platform would be impossible or too dangerous.

Arming drones with bombs and missiles has brought about one of their most significant new roles: lethal attack. Unmanned combat aerial vehicles are robots capable of eliminating targets with precision-guided munitions, such as Hellfire missiles. Still, drones can also carry nonlethal weapons designed not for killing but for incapacitating the enemy.

Drones have proven especially effective in the “three D” types of missions (dull, dirty, and dangerous). Unlike humans, drones do not lose effectiveness during long missions (for a manned multiple crew, the maximum mission time is 40 hours); while they must recharge or refuel, they do not have to rest or eat, they do not forget orders, they are not affected by gravitational pressures, and they fly at speeds that would incapacitate men (high-g maneuvers). Finally, they never suffer from combat trauma. The emerging technological breakthroughs will only continue to increase these advantages over inhabited aircraft.

Afghanistan and Iraq: The Springboard for the Robotization of Warfare

Although UAVs have crowded the airspace over Afghanistan and Iraq, both military leaders and in-country military forces have been asking for more drones. In 2001, the U.S. military had fewer than 50 aerial drones at its disposal. Demand increased dramatically, however, since the beginning of the operation in Iraq in 2003; in 2008, the U.S. armada was already composed of 5,331 drones, while in 2011, it exceeded 7,000. To meet the tempo of this expansion, in 2010, for the first time in its history, the Air Force trained more drone than fixed-wing pilots, and in 2011, there were almost 1,200 UAV pilots in service. From 2001 to 2011, the Pentagon's expenditures on drones increased sixfold compared with the previous decade, and since 9/11, with the government's budget on research and development into UAVs growing at about 23% annually, the military robotic industry has blossomed. The Pentagon drew special attention to robotic warfare in its 2012 budget request, as it plans to buy at least 730 new UAV systems by 2021. Four main tendencies have accelerated the robotization of war:

1. Advancements in unmanned technology
2. The expansion of military real-time satellite communications (vital for the control of drones and dissemination of their reconnaissance)

3. The public's low tolerance for American casualties and "force protection" paradigms—preventative efforts to mitigate or forestall hostile military action
4. The asymmetrical warfare full of risks that the U.S. troops have been increasingly confronted with since 9/11

In Afghanistan and Iraq, drones have been used primarily for intelligence, surveillance, and reconnaissance and attack missions. UAVs have tracked and engaged time-sensitive targets with speed and precision, which has not only increased the chances of eliminating them but also reduced the threat to soldiers. In Iraq, Sky Warrior (the army's version of Predator), accompanied by a unit of Apache attack helicopters and a team of 100 intelligence personnel, managed to track and kill more than 2,400 insurgents in just 1 year. Also in Iraq, two landmark events in the history of drones took place: In 2002, Predator engaged in a direct fight with an Iraqi MiG-25 and was destroyed, and in 2003, four Predators flew simultaneously in support of combat operations. Since late 2001, the United States has been sending drones to kill individuals (al Qaeda operatives, etc.) in Afghanistan, Pakistan, Somalia, Yemen, and elsewhere. Armed attacks remain, however, highly controversial due to their often ambiguous legal basis, the unknown number of militants killed, and the lack of a precise count of civilian "collateral" deaths (highly contested figures range from 5% to as much as 30% of the drones' overall casualties).

New Developments and Capabilities

Miniaturization, leading to the production of more mobile and less conspicuous drones, has probably been the most crucial trend in the development of UAVs. Minivehicles (e.g., Extender, Dragon Eye) are already capable of flying at very low altitudes, which provides excellent reconnaissance. The developments in electronics decrease not only size but also price. Some drones may be expensive (Global Hawk costs \$35 million plus \$123 million for each supporting system), while others are cheaper (Predator is \$4.3 million); microdrones are generally less than \$50,000, but robotization turns out to be a cost-effective option (e.g., for the cost of one

F-22 Raptor, the Air Force can procure up to 85 Predators).

The new unmanned capabilities have also become available because of two parallel technological advancements: (1) the production of low power-consuming devices and (2) the extension of battery life. Research is under way into new sources of powering, including nuclear isomers and laser power-beaming. Global Observer is a hydrogen-fuelled propulsion drone with an endurance of up to a week. Boeing is working on the Solar-Eagle UAV, powered by liquid hydrogen and solar energy, which could fly for 10 days. Microdrones have been loaded with electromagnets for recharging their batteries off sources of electricity such as outlets or light bulb sockets. In 2007, the Defense Advanced Research Project Agency announced its project for an ultra-endurance reconnaissance drone that could stay aloft for up to 5 years. All these innovations will enable UAVs, loaded with a greater array of more sophisticated, smaller, and lower power-consuming equipment, to carry out exceptionally long sorties. This will, in turn, bring new military applications; for example, drones carrying extremely lightweight and long-endurance jamming devices may effectively disrupt enemy communications.

New types of drones and applications for drones are now being researched or are under development, including

- drones inspired by biology, in terms of shape, maneuver techniques, and bio-sensors, as well as "insect cyborgs" (the aim of one of the Defense Advanced Research Project Agency's programs is to take control of animals through invasive electronics);
- squadrons of drones operating as a group—a development realized in May 2013 with a U.S. Navy announcement of its first drone squadron—as well as a new type of cooperation between unmanned air, ground, and sea platforms;
- new roles, such as electronic warfare (drones as airborne communications relays), submarine hunting, or air-to-air combat;
- new systems giving robots greater tactical leverage (e.g., hyperspectral imagery, which will be able to determine whether anything is hidden inside an object);

- drones operating with greater autonomy (conducting more operations without any human instruction); and
- developments in artificial intelligence.

UAVs and the Future of Air Power: Prospects and Challenges

In the future, some air force units may be formed by pilotless platforms alone. Drones have already become a regular feature of contemporary American warfare. It is estimated that since 9/11, drones have flown more than 2.3 million hours in combat operations. By 2035, the Pentagon plans to have up to 35% of all air missions conducted by UAVs. The air force wants unmanned systems to constitute at least 45% of its future large bomber fleet, although experts believe that drones will constitute up to 75% of the whole future air force. Launched in 2003, the army's Future Combat Systems assumed that each brigade may have more unmanned than manned vehicles (330:300), and each will have its own fleet of about 100 UAVs controlled at the unit level. According to the Joint Forces Command's vision, by 2025 a new military organization will rest on the "human plus a robot" paradigm as units will be composed of 150 soldiers and 2,000 unmanned platforms.

The unmanned revolution poses some serious challenges, including the following:

- To date, the United States lacks a strategy for waging wars with fleets of drones, and their comprehensive adaptation to military doctrine is badly needed.
- The increase in the autonomy of drones and the future progress in artificial intelligence raise some fundamental ethical and legal dilemmas concerning the laws of robotics, the rules of engagement, and the very rules of war.
- Fighting wars with drones flown by pilots sitting in air-conditioned trailers in the United States adds novel psychosocial dimensions to combat. Because drone operators do not experience real war but a virtual one, psychologists have begun to question the risks for operators who increasingly perceive warfare as a video game. This growing disconnectedness and risk-free combat may more easily draw the United States into conflicts.
- Fighting without leaving home brings an additional, previously unknown form of stress to soldiers who return home after operating drones on killing missions. This "war plus a family" model may generate new psychosocial costs.
- Although the unmanned revolution enables the conduct of a *real stand-off war*, that is, engaging in conflict with no human risk on the part of the UAV operator, it creates the illusion of war as a clean, safe, effective, quick, and cheap enterprise for the drone-operating nation.

Finally, the greatest challenge concerns human agency and the relationship between man and machine, because the robotic technology threatens to dehumanize not only the soldier and the enemy but also warfare itself. These challenges will become more urgent as drone warfare expands as a substantial part of any future U.S. military operation.

UPTON, EMORY

Emory Upton frequently has been called “The Army’s Alfred Thayer Mahan.” Upton is known for his efforts to document U.S. military history and reform army practices. Born in Batavia, New York, in 1839, Upton attended Oberlin College and the United States Military Academy, graduating from the latter in 1861. He was present at the Civil War’s First Battle of Bull Run, where he served as an aide-de-camp, then later commanded an artillery battery during the Peninsular Campaign and served as the chief of artillery in Major General Henry Warner Slocum’s division during the Antietam Campaign. Shortly after Antietam, the governor of New York appointed Upton to command the 121st New York Volunteers. Under his leadership, the 121st became known as “Upton’s Regulars” and fought with distinction at the Battle of Salem Church in May 1863. In July 1863, Upton took command of the 2nd Brigade, 1st Division, VI Corps of the Army of the Potomac. During Upton’s tenure, the brigade conducted two notably successful frontal assaults, the first at Rappahannock Station in November 1863 and the second against “The Muleshoe” at Spotsylvania in May 1864. After recovering from a severe wound he received in the 1864 Shenandoah Valley Campaign, Upton moved to the Western Theater where he took command of one of the divisions in James Wilson’s cavalry corps. In that capacity, he took part in Wilson’s Raid into Alabama and Georgia in March and April 1865.

After the war, Upton moved between various posts, but his focus was on the reform of the U.S. Army. He first directed his energies toward tactical reform, and the army, in 1867, adopted his proposed revision of the army’s infantry tactics manual. Not satisfied with these changes, Upton continued to ruminate on infantry tactics as well as on those for the cavalry and artillery branches. While commandant of cadets at West Point in the early 1870s, Upton prepared manuals for all three that “assimilated” their tactics and, after much debate, the army adopted them in 1874.

By then, however, Upton had turned his attention to a larger issue: the organizational and administrative problems experienced by the U.S. Army during the Civil War. Encouraged by

his mentor, Commanding General of the Army William T. Sherman, Upton began an analysis of the nation’s military shortcomings. In 1875 and 1876, Upton, accompanied by two fellow officers, spent 18 months on an around-the-world trip to see what lessons the United States might learn from other nations’ armies. Among the nations he visited were Japan, China, India, Italy, Germany, Russia, France, and Britain. Predictably, only 5 years after the Franco-Prussian War, he was quite impressed by the German army. Surprisingly, however, he also found lessons of value for the United States in the experiences of Britain’s colonial army in India. After returning home, he produced his findings in *Armies of Asia and Europe* (1878). Before this book was published, however, he had begun work on what must be seen as the first serious and scholarly, although biased, effort to analyze the history of the U.S. military system. *Military Policy of the United States*, which was incomplete at the time of Upton’s death in 1881, is unstinting in its criticism of presidents and Congress for their conduct of the nation’s military policy. Their failures, he argued, had placed the United States in grave danger ever since the nation’s inception and would continue to do so if the system’s shortcomings were not addressed. His most salient criticisms were regarding the nation’s lack of a true general staff, the weakness of the office of the commanding general, an almost nonexistent army educational system, the lack of federal control over the states’ militias, and the political interference in what Upton judged to be purely military matters.

Armies of Asia and Europe was published while Upton was serving as the superintendent of instruction at the Artillery School at Fortress Monroe, Virginia. In the summer of 1880, Upton was promoted to colonel of artillery and assigned to the command of the 4th Artillery Regiment, then stationed at the Presidio of San Francisco. Before leaving the east coast, Upton sought medical treatment for severe headaches he had been suffering since 1870. These treatments gave him no relief (it seems likely he had a benign tumor growing between his brain and nasal cavity) and, in March 1881, he committed suicide.

Upton’s immediate influence on the U.S. Army was rather small. The so-called Burnside Bill of 1878 embodied many of the reforms Upton had proposed in *Armies of Asia and Europe*, which were to become

part of his critique in *Military Policy of the United States*. The Senate, however, rejected the bill and, for the time being, legislative efforts to reform the army were dead. Upton's ideas remained influential within the army's officer corps, however, as many had read *Armies of Asia and Europe* and, after his death, copies of the unpublished manuscript of *Military Policy* circulated among its officers. In the aftermath of the debacle of the Spanish-American War, several serving officers referred Secretary of War Elihu Root to Upton's works. Root, who had been appointed after the war and who had been given the mission of bringing the army into the 20th century, was so impressed by *Military Policy* that, despite its obvious shortcomings, he had the War Department publish it in 1904. More important, it seems clear that Upton's ideas influenced the adoption of many of the so-called Root reforms.

Upton's ultimate legacy seems open to debate today. Some argue that he began the politicization of the modern officer corps and the "Germanification" of the American military. Others contend that he was simply trying to apply lessons he had learned in the Civil War while taking both German and colonial British ideas and applying them in an American context. Whichever is the case, there can be little doubt about Upton's lasting influence on the U.S. Army.

URBAN GUERRILLA MOVEMENTS

Guerrillas, traditionally, are irregular insurgent forces with significant popular support who seek to wage hit-and-run campaigns against superior forces. Guerrilla forces arise for a variety of reasons—to resist foreign occupying troops, as in the Greek and French resistance to fascist and Nazi occupation or the Spanish opposition to Napoleon; to fight against national oppressive forces, such as the FMLN in El Salvador or SWAPO in Namibia; or to seek radical political transformation in a rapid fashion, as in the case of the Maoist forces in Nepal, the mujahideen in Afghanistan, and the Zapatistas in Mexico. Urban guerrillas primarily fall within these streams but, unlike traditional guerrilla movements, urban guerrillas often lack wide public support even if they arise from populist struggles. In Western contexts, they are often elitist, inward looking, and vanguardist.

It is important to distinguish between urban guerrillas and terrorism. Terrorism is a tactic—the use of violence against nonmilitary/nonstate targets to create fear within a population to achieve political ends. Urban guerrillas may adapt terrorism as a tactic, just as they may consider nonviolent forms of resistance.

Urban guerrillas have been active in every continent except Antarctica. Even more than traditional guerrilla forces, they swim among the masses, blending in with the broader communities within which they function. Because they tend to come from middle-class, educated backgrounds, they can more easily hide within the same milieu as those they oppose.

Urban guerrilla struggles peaked during the Vietnam War and the years immediately after it, often arising from the more idealistic factions in movements for peace and social justice. The prototype urban guerrilla forces, however, arose in Ireland, the home of the Irish Republican Army (IRA) and the Ulster Defence League (UDL), and in Palestine, where the Stern Gang and the Irgun used terrorist tactics to push for an independent Jewish state in the Middle East.

The IRA and the UDL were closer to traditional militia forces, with a particular mandate to defend distinct geographical, sectarian communities. They differed from traditional militias in that they were largely covert in nature, had small autonomous groups responsible for actions, used violence against

selected targets to push a political agenda, and often pushed an agenda different from that of larger, above-ground movements. They arose from large-scale movements in Ireland in the period leading up to the Easter Rebellion of 1916 and from the partition of Ireland in 1921. By the 1960s, such forces were primarily dormant. Repression of Catholic civil rights activists in Northern Ireland led to a rebirth of both Protestant (UDL) and Catholic (IRA) paramilitary forces, both of which used violence to further sectarian ends. Overtly political urban guerrilla forces also arose, most notably the Irish National Liberation Army, which had a very specific Marxist agenda that echoed that of South American urban guerrillas. With the signing of the peace accords in 1998, there were major splits in the various sectarian guerrilla forces, with most agreeing to disarm but significant factions remaining active.

Irgun and the Stern Gang were active in Palestine in the late 1930s and early to mid-1940s. Like more contemporary urban guerrillas, they arose as part of a liberation movement. They broke with what were perceived as more moderate forces, using selective terrorist tactics against the British, Palestinians, and more moderate Jewish leaders to further the cause of an independent Jewish homeland. While few in number—some estimates place the Irgun as having no more than 50 active participants—they were able to maintain a sustained, small-scale campaign for years.

After World War II, a number of guerrilla wars were initiated as part of a global anticolonial wave and in pro- or anticommunist campaigns. Most were rural; some had a significant urban component to their struggle. The National Liberation Army of Algeria, for example, did engage in traditional struggles against the French military in rural areas but used terrorist tactics against civilian and military targets in urban areas. Forces opposed to Algerian independence also formed urban guerrilla units, both in Algeria against Algerian targets and within France itself.

In Greece, the Philippines, and Indonesia there were sizable communist uprisings that, although primarily rural, included urban guerrilla tactics. While having liberated territory was important for the insurgent forces, there was a growing realization that the location of the struggle had to change. The increased domination of urban centers resulted in shifting the focus of armed conflict from holding

land to acting in the midst of the networks of communication, finance, and administration.

This lesson was taken up by a new generation by the end of the 1950s. In South Africa, the armed wing of the African National Congress (Umkhonto we Sizwe) engaged in an urban guerrilla struggle of sabotage against both symbolic targets and essential services such as power plants. While the training of the fighters was most often done in rural areas in neighboring states, the actual struggle was primarily an urban one.

In South and Central America, the success of the Cuban revolution encouraged other radical forces to engage in armed struggle. While Fidel Castro and Che Guevara criticized the value of urban guerrilla movements, most of the movements inspired by them were urban. In nature and tactics, the urban guerrillas of the 1960s had more in common with Irgun than with the forces that fought with Castro.

The Tupamaros of Uruguay were one of the higher profile urban guerrilla movements. Their tactics were more diverse than those of many other groups: Robin Hood bank robberies that distributed money directly to the poor of Montevideo; industrial sabotage; publishing the financial records found in raids on corporate offices; extortion, kidnapping, and assassination. For much of their existence, they actually grew in popularity, linking their struggles directly to the practical needs of the people. They never actually attempted to seize power. Their actions prompted counterterrorism initiatives. When they began, Uruguay was a democracy. In 1972, the Tupamaros killed an army officer, which helped prompt a military coup and a right-wing backlash against all progressive forces in Uruguay. In 1985, with the end of the junta and reestablishment of democracy, the Tupamaros reformed as a democratic socialist party.

In Brazil, there was a effort to overthrow a military dictatorship and establish a Marxist-Leninist government by several groups that had broken away from the Brazilian Communist Party, which was perceived as too reformist. The National Liberation Action, October 8 Revolutionary Movement, and the Revolutionary People's Vanguard engaged primarily in robberies, kidnappings, and assassinations to undermine the state as a prelude to revolution. While there was some effort to build rural support and broad coalitions—an appeal to orthodox Marxist revolutionary theory—none of these groups obtained mass support.

The 1960s and early 1970s saw the birth or growth of urban guerrilla forces across the industrialized world, North and South. Some, such as Movimiento de Izquierda Revolucionaria (MIR) in Chile or Revolutionary Armed Forces in Guatemala, were rooted to some extent in a long history of revolutionary struggle even if their particular group had very little popular support.

In Europe and North America during the same time, there was a growth of urban guerrilla movements that arose in societies without such a living history. Some, such as the Front de Libération du Québec in Canada, were influenced by urban guerrilla forces in other countries and saw themselves as part of a global force against colonialism. Others, such as the Weather Underground in the United States, the Angry Brigade in the United Kingdom, and the Red Army Faction in Germany, arose from various movements for radical social change that saw it as part of their responsibility living in the belly of the beast to attack it from within.

And, although not traditionally defined as urban guerrillas, various direct action movements such as Greenpeace, the Plowshares movement, and various animal liberation forces also grew out of this radical milieu in the 1960s, sharing structure, focus, and some tactics with traditional guerrilla forces. Pouring napalm on draft records, ramming whalers, and burning down animal research facilities have much in common with urban guerrilla tactics. Martin Oppenheimer, in the classic work *The Urban Guerrilla*, included the possibility of a non-violent revolution based on nonviolent direct-action tactics.

With the defeat and withdrawal of U.S. forces from Vietnam, there was an optimism that guerrilla tactics could defeat a traditional army. In the Philippines, for example, there was a resurgence both in traditional rural guerrilla and urban guerrilla campaigns. The Moro Liberation Front, a Muslim guerrilla organization, and the New People's Army, a Maoist-inspired communist guerrilla organization, both have significant bases of support in urban areas. The successful nonviolent People's Power overthrow of the Marcos regime in 1986 resulted in an amelioration of some of the conditions that fed the guerrilla movements, but the movements continue to be active in rural and urban areas.

Israel-Palestine has seen the growth of urban guerrilla movements from those seeking an independent

Palestinian homeland. Using tactics similar to those of the Stern Gang and Irgun, groups such as al-Fatah, the Popular Front for the Liberation of Palestine, Black September, and more recently Hamas have been involved in terrorist attacks on Israeli citizens and infrastructure both in the Middle East and elsewhere.

Many nationalist movements have resorted to occasional use of urban guerrilla tactics, but not necessarily in a sustained way. Examples include the 1971 attack on the Yugoslavian Embassy in Stockholm by the right-wing Croatian group Ustaše and the 2003 attack on the National Hotel in Moscow in support of Chechnya. While not always a sustained campaign, the use of violence in urban areas has been a part of almost all modern armed struggles and is seen as essential for achieving victory.

The concluding years of the 20th century and the early years of the 21st century have witnessed a rise in urban guerrilla campaigns in such countries as Iraq, Indonesia, and Afghanistan with links to struggles in other parts of the world. These struggles are not clearly defined to external observers, often seeming to be a combination of anti-imperialism, religious sectarianism, and ethnic divisions. They are also different from many earlier expressions of urban guerrilla warfare in that they are often a part of a truly integrated struggle. Hezbollah, for example, runs hospitals and schools as well as engages in urban guerrilla campaigns. Like early rural guerrillas, these urban guerrillas are able to build up successful alternative infrastructures that Western urban guerrillas have been unable to achieve.

In North America, while attention does seem to be on the specter of Muslim terrorism, there is a growth of urban guerrilla initiatives that seem less threatening, perhaps because they are truly home-grown. The Earth Liberation Front and the Animal Liberation Front are issue-based urban guerrillas. Occupations, sometimes armed, in support of aboriginal land claims are increasing in frequency. There have been a number of attacks on abortion clinics. In nonviolent form, efforts such as Reclaim the Streets and the street resistance to various globalization initiatives continue to push for radical reclaiming of the urban space. While not terrorist, they are urban guerrilla campaigns of informal, hit-and-run actions against superior forces with the aim of social transformation.

In North America as the 21st century progresses, most attention seems to be on the specter of Islamic terrorism and not on indigenous urban guerrilla or similar initiatives. Perhaps this is because movements that engage in such tactics are truly home grown and embody responses to local issues. We have seen the rise of movements such as animal rights, with militant wings like the Animal Liberation Front and Earth Liberation Front, linked to more traditional grassroots activism. There have been a number of attacks on abortion clinics, with those involved in such attacks linked to less militant initiatives. In non-violent forms, the initiatives that have found expression early in the century in Reclaim the Streets and more recently in the Occupy Movement continue to push for radical reclaiming of urban space and the dominant political and economic agendas. While not terrorist, or even violent, these urban guerrilla campaigns include information, hit-and-run actions against superior forces with the aim of temporary disruptions of the status quo, and a desire for active radical social transformation.

U.S. AFRICA COMMAND

In February 2007, the George W. Bush administration announced changes to the Unified Command Plan that brought about the creation of the U.S. Africa Command. The U.S. Africa Command, or AFRICOM as it is widely known, is one of the newest of the Department of Defense's Unified Combatant Commands (UCC) and is responsible for coordination and execution of all U.S. military activities on the continent of Africa. The creation of AFRICOM acknowledged the strategic significance of the African continent and was the result of nearly a decade of debate within the Department of Defense. The command was created to bolster military partnerships with African states and to serve as the central coordination point for the conduct of missions ranging from theater security cooperation that builds the military capabilities of allied and friendly nations to humanitarian assistance and civil affairs.

Prior to the establishment of AFRICOM, these responsibilities had been shared by three separate UCCs—U.S. Central Command, U.S. Pacific Command, and U.S. European Command. Defense Secretary Robert Gates believed that this practice of sharing responsibilities for the African continent reflected an outdated Cold War defense mentality. The addition of AFRICOM as a separate UCC reflected the administration's stance that the preexisting Unified Command Plan was in need of significant review and change. AFRICOM provided the means to consolidate the Department of Defense's activities on the continent of Africa to make for more effective mission execution.

Deliberations for the creation of AFRICOM began in the fall of 2006 after then defense secretary Donald Rumsfeld directed Admiral Robert Moeller to lead the AFRICOM planning team to determine the feasibility of such a command. Planning began in earnest over a period of 2 months at Bolling Air Force Base in Washington, D.C. Moeller's team was tasked with outlining AFRICOM's command structure and mission, as well as identifying specific

issues that would have to be addressed prior to the creation of a new UCC. The product of this planning team was briefed to the defense secretary and subsequently forwarded to President Bush for his approval in December 2006. On review of the Department of Defense's recommendation, Bush authorized AFRICOM's creation and later directed that the command be established no later than October 1, 2007.

Like other UCCs, AFRICOM serves a specific function in support of national defense and foreign policy. As outlined in the command's mission statement, AFRICOM is responsible for a broad array of tasks on the African continent. The mission statement declares that

U.S. Africa Command protects and defends the national security interests of the United States by strengthening the defense capabilities of African states and regional organizations and, when directed, conducts military operations, in order to deter and defeat transnational threats and to provide a security environment conducive to good governance and development.

Similar to other UCCs such as U.S. Central Command and U.S. Pacific Command, AFRICOM is responsible for a specific geographic area and serves a specific function in national defense as outlined in the Unified Command Plan. The command's geographic area encompasses the whole of the African continent, with the exception of Egypt, which is still in the area of responsibility for U.S. Central Command. However, it is AFRICOM's markedly unfamiliar command structure that separates it from the other combatant commands.

The component commands of AFRICOM include Combined Joint Task Force–Horn of Africa, U.S. Army Africa, U.S. Air Forces Africa, U.S. Marine Corps Forces Africa, and U.S. Naval Forces Africa. One unique feature of AFRICOM, as compared with the other UCCs, is its integration of civilian leadership into the command structure. Although commanded by a four-star general, deputy commanders of AFRICOM are both military and civilian. AFRICOM integrates both military and civilian leadership from the Defense Department and other government agencies, such as the State Department and the U.S. Agency for International Development. The result of this structure is that many of the special staff and key functional areas not found in other combatant commands are headed by civilian

leadership. In practice, the integrated command structure of AFRICOM allows for a more concentrated focus of effort in the execution of the command's assigned tasks. This command structure was adopted to provide more effective operational ability by consolidating both military and diplomatic resources within one command. Such a structure is seen by many as a testament to interagency cooperation but has been the subject of criticism directed at the command.

The location of the headquarters for AFRICOM has been another topic of debate concerning the command. The argument was that since AFRICOM's area of responsibility is the continent of Africa, the headquarters should be located within a host nation on that continent; however, the command's headquarters are currently located at Kelley Barracks in Stuttgart, Germany. Such a practice of having a main headquarters outside the area of responsibility is not new, given that the headquarters for U.S. Central Command and U.S. Southern Command are both located in Florida. Given the compressed timeline with which the command was established, Kelley Barracks was chosen because the facilities provided the infrastructure required to support the command. In addition to the infrastructure requirements, many of the established relationships with African nations had previously fallen to the U.S. European Command. This made for a less complicated transition from one command to another. AFRICOM continues to search for a headquarters location on the African continent that has the required infrastructure established, but no such location has been found thus far.

Having a headquarters located in Europe has not prevented AFRICOM from conducting numerous bilateral and multilateral missions with African partner nations. Within months of reaching its initial operational capability, elements of AFRICOM were conducting training exercises in numerous African states, including Gabon, Burundi, and Djibouti. These exercises were conducted while simultaneously providing substantial material and logistical support to the African Union peacekeeping mission in Somalia. Through these early missions, the command developed relationships with several African nations and developed a reputation for responsiveness on the African continent.

In its short tenure as a UCC, the AFRICOM has established itself within the national defense framework and has proven to be a valuable addition to

national security by developing new relationships and expanding existing partnerships with African states. The command has expanded U.S. military activity on the continent with missions that range in scale from small contingents to large combined joint task forces. The varied nature of these missions and the focus on host nation military development have worked to overcome the perception of several African nations that the command represents a form of American power projection. In doing so, the command has increased the military capabilities of several African states to provide increased stability on the continent of Africa while ensuring that American foreign policy objectives are addressed in a timely manner.

U.S. AIR FORCE ACADEMY

The establishment of the independent U.S. Air Force (USAF) on September 18, 1947, and its remarkable growth and transformation during the early years of the Cold War, led to the creation of the Air Force Academy in 1954. The profound challenges generated by the nuclear age propelled the air force onto center stage, and the need for an undergraduate institution to train aviation officers became acute. In

a January 18, 1954, House of Representatives report (No. 1105), the Committee on Armed Services called the bill to establish the United States Air Force Academy “perhaps the most significant item in the present legislative program of the Department of Defense.” The House report argued that the nation was spending billions of dollars to purchase the best aircraft possible. Therefore, it was “no less essential that the officer personnel of the Air Force be of the highest type this country can produce.” On April 1, 1954, President Dwight D. Eisenhower authorized the establishment of the United States Air Force Academy when he signed the bill into law. This ended a 36-year struggle by air power advocates to create an air academy.

Air Power: The Early Years

An examination of the history of air power in America is crucial to understand the importance of the United States Air Force Academy. In 1907, less than 4 years after Orville and Wilbur Wright’s groundbreaking 1903 flight, the War Department created the Aeronautical Division of the Army’s Signal Corps. This small division focused on ballooning and the new air machines. In July 1914, Congress established the Aviation Section—U.S. Signal Corps, now charged with the administration of air military matters related to balloons and airplanes, including the training of officers.

At the start of World War I, both the Allies and the Central Powers used airplanes primarily for aerial observation but also experimented with arming airplanes—eventually capable of carrying small bomb loads. Aviation technology advanced quickly. By 1915, the first fighter aircraft, complete with a machine gun, became an effective offensive weapon, and the fighting quickly expanded into the sky with air-to-air combat and aerial bombing. But intelligence gathering still remained an important role for aviators. The United States entered World War I with a small air force compared with its allies and enemies alike, but the 1917 Aviation Act sought to rapidly expand U.S. air power. In May 1918, President Wilson officially separated the Aviation Section from the Signal Corps, leading to the establishment of the Air Service of the U.S. Army. As the long stalemate in ground fighting persisted, command of the sky became even more imperative, and the importance of airplanes grew.

Debates Over an Aeronautical Academy

At the end of the First World War, military and civilian air power advocates, including outspoken and controversial deputy chief of the Air Service, Brigadier General William “Billy” Mitchell, sought major changes. Stormy arguments ensued between those who wanted to keep air power under U.S. Army control and those who pushed for an independent air force. In addition, air power champions, including Lieutenant Colonel A. J. Hanlon, strongly advocated the creation of an air academy similar to West Point and Annapolis. In 1918, the director of military aeronautics, Major General William L. Kenly, created a Committee on Training to study the need for such an institution. The committee supported the establishment of an “aeronautical academy,” especially needed to replace World War I pilot casualties that they estimated to be about 20% of the American flyers. During 1919, multiple proposals for an academy circulated, and General Mitchell testified in Congress to the vital need for such an institution.

The Air Corps Act of July 2, 1926, continued to keep America’s air service—now renamed the Air Corps—as a combat arm of the army, equal to the infantry, artillery, and cavalry. The act also created the office of the assistant secretary of war for air, established an Air Corps training center, and expanded the number of airplanes, officers, and enlisted men. But economic turmoil during the Great Depression slowed down the modernization of U.S. air power, and the movement to create an air academy stagnated.

Toward an Independent Air Force and an Academy

With the start of World War II in September 1939, the U.S. government rapidly strengthened its air power, including substantial increases in personnel, airplanes, and bases. Between 1939 and 1944, air power supporters continued to push for an academy, and multiple bills came before Congress. But many War Department leaders concluded that the army and navy academies provided enough flight officers from graduates who volunteered to be commissioned in the Air Corps. Without full War Department support, all efforts to establish an air academy failed.

In June 1941, the Air Corps—now with significant independence—became the U.S. Army Air Forces (USAAF). Under the guidance of General Henry “Hap” Arnold, it quickly emerged as the largest air force in the world. The March 1942 War Department reorganization gave the USAAF autonomous command within the army. Once the United States entered the war in Europe, the Army Air Forces conducted “precision” bombing raids in an attempt to destroy the enemy’s war industry, but hitting precise targets was extremely difficult, and bombs more often hit civilian areas. Eventually, the USAAF joined the British Royal Air Force in its strategic bombing efforts that directly targeted German cities. Between 1944 and 1945, the USAAF conducted massive bombing raids on Japanese cities, primarily with the use of incendiary weapons, causing unprecedented death and destruction. On August 6, 1945, the B-29 *Enola Gay* dropped an atomic bomb on Hiroshima. A second nuclear weapon was dropped on Nagasaki on August 9, 1945. In a blinding flash, the nuclear age began.

The Cold War and the Creation of the United States Air Force Academy

American air power underwent an incredible transformation between the purchase of the nation’s first “heavier-than-air flying machine” from the Wright brothers in 1909 and the B-29s that delivered nuclear weapons in 1945. The atomic bomb drastically altered the nature of warfare, and the air force now held a favorable position to the other branches of the U.S. military in terms of funding since it could deliver the nuclear payload. With the conclusion of World War II, the drive for an air academy found new energy when Henry L. Stimson, the secretary of war, reconsidered his position. But delays in establishing an academy occurred with disagreement over various provisions. Also, the push for an independent air force took top priority. Independence came with the 1947 National Security Act that created the Department of Defense with three coequal subdepartments—the Army, the Navy, and the Air Force. Now, attention reverted back to the creation of an air academy, and numerous proposals, bills, and planning board reports quickly followed. Although progress was achieved, the start of the Korean War sidelined the air academy effort.

Shortly after World War II, former allies became fierce enemies as conflicts arose between the United States and the Soviet Union. During the 1950s, the role of the USAF became vital to President Dwight D. Eisenhower's Cold War foreign policy. Eisenhower's "New Look" emphasized the threat of massive retaliation with nuclear weapons to deter Soviet advancement. The USAF, for the Eisenhower administration, represented the first line of defense in an atomic air strike. While the army and the navy saw cutbacks, the air force budget was increased by \$800 million, and massive stockpiling of nuclear weapons and missile development continued as an arms race ensued.

Under these circumstances, college-educated young men were desperately needed to help the USAF succeed in the crucial role during the Cold War. In January 1953, the Department of Defense proposed legislation that would establish an air force academy. Civilian and military air power advocates argued that the aviation cadet program and the Air Force Reserve Officers' Training Corps could not provide enough career officers who had the educational qualifications required by the air force. Procuring graduates from the United States Military Academy and the United States Naval Academy (up to 25% of graduate volunteers could receive commissions in the air force) did not supply enough officers. Furthermore, air power champions argued that specialized training was crucial for the success of future air force officers—especially in the new nuclear world.

The New Air Force Academy

After fighting for an air force academy since 1918, military and civilian air power advocates finally realized their goal. In a January 1954 House Report, the Committee on Armed Services agreed that the creation of an undergraduate institution was necessary. The bill dictated that the air force academy should be comparable to both West Point and Annapolis. In a March 3, 1954, Senate report (Report 1041), the Committee on Armed Services concurred, "in the interest of national defense," and noted that civilian colleges did not represent a "stable source of career Regular officers for the Armed Services." Convinced of the need for an air force academy, President Eisenhower readily signed the bill. Lieutenant General Hubert R. Harmon became the U.S. Air

Force Academy's first superintendent. Harmon had a distinguished military career and was instrumental in the establishment of the academy.

After considering 580 possible sites in 45 states, the Air Force Academy Site Selection Board made their choice of a location in Colorado Springs, 60 miles from Denver, Colorado. Not everyone was content with the decision, nor did everyone appreciate the ultramodern architecture based on the postwar international style. Architect Frank Lloyd Wright even criticized the design at a U.S. House of Representatives subcommittee hearing and urged that work on the building be postponed until new plans could be drawn up. Others applauded the contemporary design and the spectacular setting in the foothills of the Rocky Mountains. The site included 18,500 acres, and the original construction of academy buildings cost approximately \$142 million. Once the academy became a reality, board leaders selected faculty members, created the cadet honor code, agreed on a cadet uniform, and supervised construction. The Class of 1959—the first class—consisted of 306 young men who were sworn in at Lowry Air Force Base in Denver (site of the temporary institution until construction was complete). Demands brought on by the Vietnam War resulted in a great expansion of the academy. The first Black professor joined the faculty in the early 1960s, and the first three African American cadets graduated from the U.S. Air Force Academy in 1963. Legislation signed by President Gerald R. Ford in 1975 opened up the academy to women, and the following year, 157 women became air cadets as members of the Class of 1980.

Today's Academy

Today, the United States Air Force Academy is considered one of the leading 4-year undergraduate institutions in the country with a nationally recognized faculty. Some 4,400 cadets receive training and education at the academy in a community with more than 25,000 military and civilian personnel. About 75% of the 560 faculty members are air force officers, and close to 57% of the faculty hold doctorates or terminal degrees. Admission is very selective, and students are accepted based on academic achievement, test scores, leadership skills, and physical fitness. All candidates must be nominated (usually by a member of Congress).

The academy offers more than 500 courses in 32 majors (along with two minors) designed to educate, train, and inspire air and space leaders. The curriculum focuses on engineering, basic sciences, humanities, and social sciences and on military studies, extensive physical training and athletics, and leadership development. Flight training, astronomy, navigation, parachuting, and other aviation courses are included in the cadets' studies. Combat survival training is mandatory. Students are required to take part in either intercollegiate or intramural athletics and must pass a yearly fitness test. Sports include 17 men's and 10 women's National Collegiate Athletic Association-sanctioned teams.

The demographics profile for the Class of 2013 indicates that there are 1,368 cadets enrolled, with 277 (20.3%) of the class being female and 312 (23%) being minorities. The Class of 2013 includes 11 international students. Fifty-three percent of the Class of 2013 ranked in the top 10% of their high school class and were very active in student government, debate teams, school newspapers, scouting, athletics, and many other extracurricular activities. More than 80% of cadets received athletic letter awards while in high school.

The U.S. government covers the cost of tuition along with room and board, and officer candidates receive a monthly stipend. Successful graduates become commissioned as second lieutenants in the USAF. Over the past decade, there have been allegations of widespread academic cheating, sexual harassment and assault, and religious proselytizing. The academy quickly responded by adopting policies concerning religious freedom, sexual harassment, and gender discrimination. In 2010, the academy hired a chief diversity officer.

Conclusions

Graduates of the U.S. Air Force Academy played an important role in the nation's conflicts starting in the second half of the 20th century, including in the recent wars in Iraq and Afghanistan. In addition to commissions in the USAF, some graduates are active as astronauts, engineers, and mission support specialists in the U.S. space program. Now, flying incredible air machines that Orville and Wilbur Wright could only imagine, male and female graduates of the Air Force Academy are soaring into the future.

U.S. CENTRAL COMMAND

U.S. Central Command (USCENTCOM) is the geographic combatant command responsible for the Middle East and Southwest Asia. It was established on January 1, 1983. Its headquarters are at MacDill Air Force Base, Florida. USCENTCOM has undergone a number of boundary changes since it was created, and as of January 1, 2011, its responsibility covers Egypt, the Levant (Jordan, Syria, and Lebanon but not Israel, which is in U.S. European Command), the Arabian Peninsula (Saudi Arabia, Yemen, Oman, the United Arab Emirates, Qatar, Bahrain, Kuwait, and Iraq), Central Asia (Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, Uzbekistan), and South Asia (Iran, Afghanistan, and Pakistan). USCENTCOM was responsible for military operations in the Persian Gulf War, the Somalia Intervention, the Afghanistan War, the Iraq War, and a number of other military operations.

Subordinate Commands

USCENTCOM has five subordinate component commands: Army Forces Central (ARCENT),

Navy Forces Central (NAVCENT), Air Forces Central (AFCENT), Marine Forces Central (MARCENT), and Special Operations Command Central (SOCCENT). The Commanding General of the Third Army serves as ARCENT commander; Commander of the Fifth Fleet serves as NAVCENT commander. The Commander of the Ninth Air Force served as AFCENT commander until 2009, when the commands were split and AFCENT was established as a separate command. ARCENT, NAVCENT, AFCENT, and SOCCENT also serve as functional component commands: Coalition Forces Land Component (CFLCC), Maritime Component (CFMCC), Air Component (CFACC), and Special Operations Component (CFSOCC), respectively.

USCENTCOM has also relied on a number of subordinate Joint Task Forces (JTFs) to conduct operations. The most notable have been JTF Southern Watch (1994–2003), Combined Joint Task Force–Horn of Africa (CJTF-HOA; 2002, passed to U.S. Africa Command in 2008), Combined Joint Task Force 7 (CJTF-7; Iraq, 2003–2004), Combined Forces Command–Afghanistan (2003–2007), Multi-National Forces Iraq (MNF-I; 2004–2010), U.S. Forces Afghanistan (USFOR-A; 2008 to the present), and U.S. Forces Iraq (USF-I; 2010–2011).

Origins of USCENTCOM

After World War II, the United States and Britain agreed that the British would be primarily responsible for security in the Middle East. When the British announced in 1967 that they would withdraw from “East of Aden,” the United States faced a potential security vacuum in the region. Following a policy of reliance on regional partners epitomized by “Vietnamization,” the U.S. government began to provide extensive security assistance to Saudi Arabia and Iran as a way to protect U.S. interests and counter Soviet influence in the region.

In 1977, President Jimmy Carter asked the Joint Chiefs of Staff to look into the feasibility of creating a multidivision rapid deployment force for the Middle East. This suggestion lay dormant until January 1979, when the Iranian Revolution toppled the Shah and with him the main pillar of the American security position in the region. On October 22, 1979, the secretary of defense directed the Joint Chiefs of Staff to look into creating a multidivision force earmarked for rapid deployment to the Middle East.

This mission took on a new urgency when students seized the U.S. Embassy in Tehran on November 4, and it became even more pressing when the Soviet Union moved into Afghanistan on Christmas Eve.

The Rapid Deployment Joint Task Force (RDJTF) was officially established in March 1980. Subordinate to U.S. Readiness Command, it was colocated with the headquarters at MacDill Air Force Base, Florida. On October 1, 1981, the RDJTF was given responsibility for the Middle East and began reporting directly to the Joint Chiefs of Staff. USCENTCOM was activated on January 1, 1983.

The boundaries of USCENTCOM were determined by its Cold War mission to maintain control of the vital sea lanes through the Red Sea and Arabian Gulf. It included Egypt, Sudan, Ethiopia, Djibouti, and Somalia in the Horn of Africa; Jordan, Saudi Arabia, the Yemen Arab Republic, the People’s Democratic Republic of Yemen, Oman, the United Arab Emirates, Qatar, Bahrain, Kuwait, and Iraq in the Arabian Peninsula, as well as Iran, Afghanistan, and Pakistan. The “frontline states” of Israel, Lebanon, and Syria were excluded from the area of responsibility.

Early Operations

When USCENTCOM was established, Pakistan was an important conduit for support to the mujahideen fighting against the Soviets in Afghanistan. The Iran-Iraq War (1980–1988) was also under way, and Iran laid mines in the Arabian Gulf to block oil shipments. On May 17, 1987, an Iraqi aircraft fired two Exocet missiles that hit the USS *Stark* (FFG 31), killing 37 members of her crew. In July 1987, Iranian mining operations in the Persian Gulf led the United States to reflag and escort Kuwaiti oil tankers in Operation Earnest Will. On April 14, 1988, the USS *Samuel B. Roberts* (FFG 58), while participating in Operation Earnest Will, struck an Iranian mine. In response, USCENTCOM began Operation Praying Mantis on April 18, 1988. This was the largest surface engagement by the U.S. Navy since World War II and resulted in the sinking of an Iranian frigate and gunboat along with a number of smaller craft.

Persian Gulf War

After Iraq invaded Kuwait in August 1990, USCENTCOM conducted Operation Desert Shield to defend Saudi Arabia. The USCENTCOM

commander, General H. Norman Schwarzkopf, moved his headquarters to Saudi Arabia and assumed command of a coalition force. Operation Desert Storm, the liberation of Kuwait, began with an air campaign on January 17, 1991, with the ground attack commencing on February 24, 1991. Operations ended on February 28.

Somalia Intervention

While USCENTCOM was making its final preparations for Desert Storm, civil war in Somalia reached the capital of Mogadishu. Between January 5 and 6, 1992, USCENTCOM conducted Operation Eastern Exit to evacuate the U.S. Embassy.

After the government of Somalia collapsed, the country fell into anarchy, resulting in a devastating famine. On August 16, 1992, USCENTCOM began Operation Provide Relief using aircraft based in Mombasa, Kenya, to fly relief supplies into Somalia. This operation also provided the first test for the USCENTCOM forward command structure when Brigadier General Frank Libutti, United States Marine Corps, Commander Forward Headquarters Element/Inspector General of the USCENTCOM, assumed command of Joint Task Force Provide Relief. Warlords continued to interfere with international relief efforts, however, and on December 9, 1992, USCENTCOM launched Operation Restore Hope to create a secure environment for the delivery of humanitarian aid and established Unified Task Force Somalia (UNITAF) to conduct this operation. UNITAF turned over responsibility to United Nations Organization Somalia II (UNOSOM II) on May 4, 1993. USCENTCOM retained responsibility for a battalion task force left under American command to act as a quick reaction force and also for the Special Operations Forces. A raid conducted on October 3, 1993, resulted in a major battle in which 18 Americans were killed. On October 7, 1993, President Bill Clinton announced that American forces would no longer participate in combat operations and would withdraw by March 31, 1995. In 1995, USCENTCOM conducted Operation United Shield to cover the withdrawal of UNOSOM II.

Continuing Operations against Iraq

When Desert Storm ended, USCENTCOM enforced a “no-fly” zone over southern Iraq and conducted

maritime interdiction operations to ensure Iraqi compliance with UN Security Council Resolutions. By the summer of 1992, it was clear that Iraq was not going to comply, and in August, USCENTCOM established Joint Task Force Southern Watch. Over the next decade, USCENTCOM conducted numerous operations to deal with Iraqi provocations, including Operations Vigilant Warrior (1994, defense of Arabian Peninsula), Vigilant Sentinel (1995, defense of Arabian Peninsula), Desert Strike (response to Iraqi aggression against Kurds), Desert Thunder I, Desert Thunder II, and Desert Fox (all in 1998 to force compliance with UN inspections).

Operation Southern Watch required USCENTCOM to maintain significant numbers of American and coalition troops in Saudi Arabia. Extremist elements were incensed by the American presence in “the Land of the Two Holy Mosques,” and in 1996, al Qaeda bombed a U.S. military barrack at Khobar Towers, killing 19 airmen. In 1998, al Qaeda bombed the U.S. Embassies in Tanzania and Kenya. In 2000, al Qaeda conducted a suicide attack against the USS *Cole* (DDG 67) while it was in Aden, Yemen, killing 17 sailors.

Operation Enduring Freedom

Following the September 11, 2001, terrorist attacks, USCENTCOM launched Operation Enduring Freedom on October 7, 2001. The initial campaign relied on small detachments of special operations troops embedded with the Northern Alliance, the Afghan forces opposed to the Taliban. Kabul was liberated on November 13, 2001, and the Taliban abandoned Kandahar, their main base, on December 7, 2001.

On May 31, 2002, USCENTCOM established CJTF-180 to serve as the JTF responsible for Afghanistan. In November 2003, USCENTCOM established a new headquarters, Combined Forces Command–Afghanistan (CFC-A), with CJTF-180 remaining as a subordinate headquarters.

Combined Joint Task Force–Horn of Africa

In 2001, Somalia remained as lawless as it had been when the American forces left in 1995. Concerned about the potential for al Qaeda and other terrorist organizations to establish bases in this ungoverned area, in 2002, USCENTCOM established CJTF-HOA to conduct counterterrorism operations in the region. Based at Camp Lemonier, Djibouti,

CJTF-HOA soon realized that the best way to counter terrorist activities was to prevent these organizations from establishing a foothold, and the best way to accomplish this was to assist the regional countries in developing good governance and effective security forces. CJTF-HOA quickly established civic action and training programs in Djibouti, Ethiopia, and Kenya, along with Yemen in the Arabian Peninsula, and later expanded its activities into Uganda and Tanzania, which were in European Command's area of responsibility. On October 1, 2008, responsibility for the HOA (except for Egypt) and therefore CJTF-HOA was transferred to U.S. Africa Command. The Red Sea, Gulf of Oman, and waters off Somalia remained in the USCENTCOM's area of responsibility.

Iraq War

Operation Iraqi Freedom commenced on March 17, 2003 (this also marked the end of Operation Southern Watch, which had continued uninterrupted since 1994). Baghdad fell on April 9, 2003. On June 15, 2003, USCENTCOM established CJTF-7, commanded by Lieutenant General Ricardo Sanchez, to serve as the military headquarters for Iraq. CJTF-7 worked with the Coalition Provisional Authority (CPA), although the division of responsibility between the two organizations was never clarified. More than 25 coalition partners joined this phase of Operation Iraqi Freedom, with the United Kingdom, Poland, and the Republic of Korea assuming command of multinational divisions.

One of the first acts of the CPA was disbanding the Iraqi army. CPA started to create a new force, called the "New Iraqi Army" (NIA) to disassociate it from the abuses of the Saddam regime. This force was to be focused solely on external threats and to have no internal security role. By autumn 2003, however, it was clear that a major insurgency was under way. The creation of the New Iraqi Army was accelerated, and local forces of part-time soldiers, the Iraqi Civil Defense Corps, were raised. Coalition forces also began to train Iraqi police forces.

As the insurgency progressed, it became clear that a single, corps-level headquarters was not adequate, and preparations were made to split CJTF-7 to establish two new headquarters. On April 15, 2003, Multi-National Corps Iraq (MNC-I), with Lieutenant General Thomas F. Metz, in command,

was established as an operational headquarters subordinate to CJTF-7. On May 15, 2004, CJTF-7 was redesignated Multi-National Force Iraq (MNF-I). The same day, Multi-National Security Transition Command Iraq (MNSTC-I) was established as a subordinate command, with Lieutenant General David H. Petraeus, in command. This relieved the USCENTCOM commander of the burden of day-to-day operations in Iraq, allowing him to refocus on the theater as a whole. MNF-I focused on the overall strategic situation, including the development of the Iraqi Government and institutions, while MNC-I concentrated on operations. MNSTC-I refocused the development of the Iraqi Armed Forces. The term *New Iraqi Army* was dropped, the Iraqi Civil Defense Corps was reorganized first as the Iraqi National Guard and then integrated into the regular army, and the army was expanded to become a multidivision counterinsurgency force. On July 1, General George W. Casey Jr. assumed command of MNF-I, establishing it as a four-star headquarters.

The bombing of the Golden Mosque in Samarra on February 22, 2006, marked a turning point in the insurgency, as full-blown ethnic violence erupted. By late 2006, however, many Sunni leaders who had initially supported al Qaeda turned against the terrorists and opened negotiations with the American military commanders in a process dubbed the "Anbar Awakening." Local American commanders began to support Sunni tribal militias, which were renamed the "Sons of Iraq" and eventually given a formal status.

In January 2007, President George W. Bush decided to increase the number of American combat units from 15 to 20 combat brigades and to increase overall troop strength from 150,000 to 170,000. This increase was planned to last for a year and was known as "The Surge." In conjunction with "The Surge," the new commander of MNF-I, General David H. Petraeus, implemented a new counterinsurgency strategy, moving troops from large forward operating bases (FOBs) into small combat outposts (COPs) to live with Iraqi soldiers and police and provide 24-hour security to neighborhoods. While casualties initially increased significantly, the combination of increased forces, new tactics, and Sunni cooperation broke the back of al Qaeda and the insurgency. Coalition and civilian casualties fell precipitously in the fall of 2007, and by the end of 2008, they had fallen below 2004 levels.

Through 2009, the last coalition partners withdrew their forces, and MNF-I began reducing American combat strength. The last combat brigade departed on August 19, 2010. On August 31, 2010, Operation Iraqi Freedom officially ended, and on September 1, 2010, Operation New Dawn began. MNF-I was officially redesignated as U.S. Forces Iraq (USF-I), with MNC-I becoming U.S. Corps Iraq. By December 31, 2010, American forces had drawn down to 50,000 personnel in Iraq.

Afghanistan War

In Afghanistan, during 2004 and 2005 the Taliban began to recover from its initial defeat and a significant insurgency began to develop, mainly among the Pashtun tribes in the east and south. These tribes straddled the border between Afghanistan and Pakistan, and the Taliban used the Pashtun areas of Pakistan as a safe haven to organize and regroup. In January 2004, International Security Assistance Force (ISAF) was established under the authority of UN Security Council Resolution 1386 to provide security in Kabul. On August 11, 2003, the North Atlantic Treaty Organization assumed responsibility for command and control of ISAF, and in December 2004, NATO announced that it would expand ISAF's responsibility beyond Kabul. Throughout 2005 and 2006, CFC-A gradually turned over responsibility to ISAF, with ISAF taking control of the last sector, Regional Command East (RC-East), on October 5, 2006. In January 2007, CFC-A was formally disestablished. The two main American headquarters, CJTF-76 (formerly CJTF-180) and RC-East, and Combined Security Transition Command Afghanistan (CSTC-A) now had a dual chain of command, reporting directly to USCENTCOM as their senior American commander and also to the senior NATO officer, Supreme Allied Commander Europe, through Commander ISAF, for most operational matters.

By the end of 2007, it became clear that this arrangement was unwieldy, and in October 2008, USCENTCOM established U.S. Forces Afghanistan (USFOR-A). The Commander ISAF, an American officer, was also designated Commander USFOR-A, establishing unity of command.

The situation in Afghanistan continued to deteriorate after the transition to ISAF in 2006. In March 2009, President Barack Obama approved increases

totaling 34,000 new troops, doubling the American commitment to Afghanistan. This increase led to a major strategy review by the administration. On December 1, 2009, Obama announced that he was sending an additional 30,000 troops to Afghanistan by August 2010, bringing the total to 99,000 American troops. This reinforcement would last for a year, at which point the United States would begin to reduce its forces.

Piracy

The anarchic conditions in Somalia made it easy for criminal activity to flourish, and by 2005, piracy had become a significant issue off the coast. NAVCENT, which also served as CFMCC and Commander, Coalition Maritime Forces (CMF), already had a coalition task force in waters off Somalia, CTF-150, which was supporting Operation Enduring Freedom. On January 2009, NAVCENT established CTF-151 specifically for the counterpiracy mission. NATO and the European Union also established antipiracy task forces, and a number of countries dispatched warships on independent missions. The NAVCENT commander, in his capacity as Commander CMF, worked to coordinate the activities of all these ships.

U.S. COAST GUARD ACADEMY

The U.S. Coast Guard Academy is an institution of higher education designed to produce trained officers for the Coast Guard. Modeled after the military academies, the Coast Guard Academy has an enrollment of 1,000 cadets, graduating 200 cadets a year with bachelor of science degrees. Tuition is free—cadets are paid a salary—and there are no graduate programs. All alumni enter the Coast Guard for at least 5 years. About 80% undertake postgraduate education at service schools and other institutions of higher learning with financial support from the Coast Guard, and 85% continue as Coast Guard officers after their required tour.

The Treasury Department's Revenue Cutter Service, a precursor to the Coast Guard, recognized it needed better trained officers and set up a school of instruction in 1876. Using a sailing vessel known as a revenue cutter for a campus, the school provided a free 2-year apprenticeship for 5 to 10 cadets per class, with academic lectures by one professor. A third year of instruction was added in 1903. The school's base in 1910 became Fort Trumbull, near

New London, Connecticut, where facilities from an old army fort supplemented the cutter. With the 1915 merger of the Revenue Cutter Service and the Life Saving Service into the Coast Guard, it became the Coast Guard Academy.

The academy moved to its present location in New London in 1932, with the opening of Hamilton Hall for administration and classes and with Chase Hall replacing the cutter as a dormitory. By 1941, the academy provided an accredited 4-year engineering bachelor's degree, taught largely by Coast Guard officers on temporary assignment. During World War II, the Candidate for Reserve Commission program trained 200 officers a month.

The academy faced a major crisis in the 1950s, with its very existence in question, as senior Coast Guard officials were dismayed that so many cadets were primarily interested in an accredited engineering degree, which they could quickly parlay into high-paying civilian jobs. Indeed, only 30% of entering students graduated. The solution was to restructure the cadet experience in close accord with West Point and the other military academies, bringing in younger Coast Guard officers to provide role models and closely controlled training. The Cadet Corps was doubled in size to 1,000 students and reorganized in terms of companies. Cadets stay in the same company from their days as swabs (new freshman) until their first-year experience, when they have significant leadership responsibilities. The result was 4 years of highly regimented and tightly scheduled daily routines starting at reveille at 6 a.m., with strict enforcement of numerous regulations and restriction to campus during the week. Cut off from old habits and surroundings, and under intense psychological pressure from upper-classmen, many swabs dropped out. The majority accepted the harassment to prove their manhood. The announced goal was to develop leaders, while the implicit goal was to internalize acceptance of a rigid hierarchical command structure, which was considered essential in dealing with emergency situations such as rescues at sea.

At the same time, academics were restructured to bring in a strong academic dean and to create the opportunity to major in a field. Of the 66 faculty in 1961, only 4 had doctorates, so the reforms called for sharply upgrading faculty credentials. More civilians were hired, and less use was made of temporary Coast Guard officers as teachers.

Professional courses, such as training for navigation, rescue operations, gunnery, and seamanship, were increasingly taken out of the academic curriculum and put into summer programs. Facilities were expanded in the 1960s and 1970s. Specialized facilities include competitive sailing and rowing facilities, and most famously, the tall ship *Eagle*, which is used for numerous training exercises in seamanship.

Unlike the military academies, where members of Congress nominate recruits, the academy reached out to a national audience with admission based on high school performance and tests. As college tuition had soared around the country, the attractiveness of the free tuition—as well as guaranteed good jobs for graduates—made admission more and more competitive, especially to prospective students along the East Coast. Ninety percent of those admitted rank in the top 10% of their high school class. Surveys of cadets showed that they had a very negative opinion of the dormitory facilities, the mess halls, the library, and the city of New London. Like cadets at the other military academies, the students are conservative politically, study intensively, seldom use drugs, interact often with their professors, and score at the bottom of American colleges in reporting a “happy” undergraduate experience. They undergo a rigorous core curriculum for the first 2 years, emphasizing engineering, mathematics, and science. A few electives are allowed to upperclassmen, whose preferred majors include business management, civil engineering, and government.

During World War II, the academy had an 8-week training program for officers of the women’s auxiliary, the SPARS (whose name is an acronym for the Coast Guard motto *Semper Paratus* and its English translation, Always Ready). Women were first admitted as cadets in 1975 and have experienced more acceptance than have women at the traditional military academies. Women now constitute 27% of the academy’s cadets. Racial integration was imposed by Washington in the 1970s and has proceeded relatively smoothly compared with other services and the other academies. Sports are heavily emphasized, with all cadets required to participate in intramural or intercollegiate teams.

The Coast Guard ethos is not primarily a militaristic, combat-oriented ethos as typified by West Point. Since the Coast Guard is part of the Navy in wartime, it does have a military history, but a more typical hero is Lieutenant D. H. Jarvis who

led a 1,500-mile expedition across the frozen Arctic Ocean in 1897–1898 to rescue marooned whalers. Many, if not most, of the cadets are attracted by the humanitarian dimension of lifesaving, as well as the promise of frequent action in extreme circumstances. Since the Coast Guard was moved from the Department of Transportation to the Department of Homeland Security after 9/11, the defense of the coastline against terrorists and drug smugglers has become a much higher priority. The rescue mission remains important, and recently the environmental protection mission has soared in importance, as typified by the Coast Guard taking charge of the federal response to the Gulf oil spill of 2010. Environmental and humanitarian dimensions attract different types of cadets, especially women.

Until 2005, all new graduates went to sea, serving on the cutters that provided the main mission for the Coast Guard. Recently, however, some graduates are never sent to sea and are assigned instead to aviation or ground-based units. The crowded 120-acre campus on the Thames River is shared with the Coast Guard’s Officer Candidate School and Leadership Development Center, which provides on-campus and online training to permanent Coast Guard personnel.

U.S. MILITARY ACADEMY

The United States Military Academy (USMA), alternately known as “West Point,” is the oldest federal military academy in the United States, founded in 1802 during the first administration of President Thomas Jefferson. The military post here, located on the “West Point” of the Hudson River in the Hudson Highlands of New York, is the longest active-serving cantonment in the U.S. Army, having been continuously garrisoned since the War for Independence. West Point trains only approximately 20% of the junior officers commissioned annually, but the academy plays a disproportionate role in training future officers who emerge as the nation’s senior military officers. West Point enrolls about 4,400 cadets drawn from all 50 states and a number of foreign countries. Although historically a rigid color bar limited the number of African American and other minority candidates, the academy has made a concerted effort to recruit minorities to the institution and 15% to 20% of the Corps of Cadets are made up of minority groups. Women first entered the Academy in 1976 and they made up 17% of the Class of 2011. There has been considerable resistance to the presence of women at the Academy, and the institution has struggled with issues of sexual harassment and violence directed at women cadets.

West Point has traditionally emphasized a core curriculum that emphasizes training in engineering and military science. This focus remains, but in recent years the academy has expanded the core curriculum to include coursework in the humanities and social sciences. The academy offers majors in 42 fields of study and is accredited by the Mid-Atlantic Association of Colleges and Schools. Faculty-student ratio is 1:8, with faculty consisting of both commissioned military officers and civilian professors. Class sizes are typically small, usually 12 to 18 students.

Although cadets pay no tuition, they are obligated to serve in the military after graduation. Physical and military training is an integral part of the educational experiences with much of this taking place over the summer months. For instance, all male cadets take boxing or wrestling as plebes (the first year at the academy), and women must take a self-defense course.

Founding and Early Years

During the Revolutionary War, Congress appointed a committee to establish a military academy to provide trained, professional officers to the Continental Army, but there is no record that this plan was ever submitted or acted on. In the two decades following the Revolution, West Point served as a training ground for artilleryists and engineers in the fledgling U.S. Army. Captain Henry Burbeck pushed General Henry Knox to create a military academy as early as 1782, and by 1801, the then colonel Burbeck had convinced Secretary of War Henry Dearborn to transfer cadets who had been training at other military posts to West Point, where artillery and engineer cadets were already being schooled in their profession. He also persuaded President Thomas Jefferson—who saw the establishment of such a school as an opportunity to break the stronghold on the officer corps then held by the Federalist Party—to officially create a formal academy for officers. On March 16, 1802, Jefferson signed the Act of Congress that founded the USMA and created the U.S. Army Corps of Engineers.

The academy’s seminal superintendent was Major Jonathan Williams, who also served as the Army’s Chief of Engineers as well as Inspector of Fortifications. Although some historians allege that the academy was established merely to train and educate engineer cadets, from its very inception cadets from the other army branches were schooled there. However, a strong engineering curriculum was, and still is, a West Point hallmark. Williams grew disgusted with the lack of support from the government and resigned in 1803, but Jefferson convinced him to return to his post in 1805. In the interim, the academy was run by an acting superintendent, Decius Wadsworth. In 1812, Colonel Joseph Swift, West Point’s first graduate, took over as superintendent. Since the law that created the academy also specified that the superintendent would concurrently serve as the Chief of Engineers, Swift was away from West Point a great deal of time, leaving an 1806 graduate, Captain Alden Partridge, to run the daily activities of the academy in his stead. Partridge caused nothing but problems for Colonel Swift, and in 1817, the captain was court-martialed for, and convicted of, disobedience. Partridge subsequently resigned from the army and went on to establish the oldest private

military college in the United States, now known as Norwich University. Swift himself resigned the next year, to be replaced by Sylvanus Thayer, an 1808 graduate, the man who one day would be called the “Father of the Military Academy.”

Sylvanus Thayer: Father of West Point

Swift had made some positive changes during his tenure, despite his problems with Partridge: a 4-year curriculum had been instituted, a “Board of Visitors” had been created (distinguished citizens who came to West Point yearly to inspect and report), and twice-a-year examinations were held. It was Thayer, however, who would make even more long-lasting changes to the academy. Thayer had visited France’s *L’Ecole Polytechnique* and brought back ideas that he would integrate into the curriculum and administration at West Point. Unlike his predecessors, Thayer was not encumbered by also having to wear the hat of chief of engineers and, thus, could devote all of his energy to improving the school. One of Thayer’s important reforms was the creation of an academic board comprising the superintendent, the commandant of cadets, and the heads of the academic departments. Its responsibilities included all matters relating to curriculum, the conduct of examinations, the ranking of cadets by class standing, and recommending the branch of the army in which they should be commissioned on graduation. Another Thayer reform dealt with matters of cadet discipline: Cadets receiving more than 200 demerits per year could be discharged from the academy. A significant change, though not Thayer’s idea but originating from the War Department, was the practice of allocating one cadet appointment per congressional district, an additional two appointments for each state “at large,” and another dozen or more to the president or his cabinet to nominate. This practice began under Thayer’s charge but did not become law until 1843.

From 1833 to the Civil War

After Thayer’s retirement in 1833, a string of superintendents succeeded him until the Civil War: Major Rene De Russey, Major Richard Delafield, Captain Henry Brewerton, Brevet Colonel Robert E. Lee, Captain John G. Barnard, and Brevet Major P. G. T. Beauregard. Of these, Delafield served

thrice—from 1838 to 1845, 1856 to 1861, and then again for a short stint from January 1861 to March 1861, when Beauregard was relieved after only days in office for fear of his disloyalty to the Union. During this period, the faculty was dominated by internationally recognized scholars in their respective fields of endeavor, among them William H. C. Bartlett (Class of 1826), professor of natural and experimental philosophy; Jacob W. Bailey (Class of 1832), professor of chemistry, mineralogy, and geology; Albert E. Church (Class of 1828), professor of mathematics; and especially Dennis Hart Mahan (Class of 1824), professor of civil and military engineering and the art of war (and father of the naval strategist Alfred Thayer Mahan). All graduated from the academy during Thayer’s reign as superintendent (although they were civilians by the time they had become senior members of the faculty), and all would influence a generation of graduates who, as relatively junior officers, would serve their nation with distinction during the Mexican-American War and later rise to be high-ranking officers on the contending sides during the Civil War.

During the Mexican-American War, 543 graduates fought in the conflict, of whom 49 were killed and 90 wounded. Four-hundred and forty-seven were promoted or brevetted for gallantry in action, including Robert E. Lee (Class of 1829), George McClellan (Class of 1846), William B. Franklin (Class of 1843), George G. Meade (Class of 1835), Ulysses Grant (Class of 1843), William T. Sherman (Class of 1840), and Thomas J. Jackson (Class of 1846). One of the two principal commanders during the war, Major General Winfield Scott, though not a West Point graduate himself, later heaped praise on the academy graduates who had fought in the conflict.

The Civil War and Post-Civil War Years

Robert E. Lee returned to the academy in the late summer of 1852 to become the ninth superintendent. His commandant of cadets was Major Robert S. Garnett. Both were Virginians and destined to become Confederate generals, with Garnett becoming the first general officer to be killed in action during the war, at Corrick’s Ford, (West) Virginia, on July 13, 1861. Members of the staff and faculty serving under Lee at West Point included another

Virginian, George Thomas (who remained loyal to the Union and in September 1863 earned the moniker, “The Rock of Chickamauga”), and Fitz John Porter, who as commander of the Army of the Potomac’s Fifth Corps would fight against Lee in 1862. In addition, many of the cadets then in attendance would become deadly enemies just a few years later. During Lee’s tenure, the most significant modification to the curriculum was the addition of another year of study, beginning in 1854, bringing the required number of years for graduation to five. This change, however, was short lived. When the Civil War began in 1861, West Point graduated two classes one month apart, the first in May and the other in June, and suspended the 5-year curriculum. While Lee was superintendent, a huge indoor riding hall was constructed, at the whopping price of \$22,000 (more than half a million dollars today). Finally, the West Point Museum was established under Lee’s supervision in 1854 to support the curriculum and remains today the oldest continuous museum in the U.S. Army.

During the nation’s fratricidal conflict from 1861 to 1865, West Point graduates were at the forefront of their respective armies, and one graduate, Jefferson Davis (Class of 1828), was the president of the Confederate States of America. Of the 936 graduates from the classes between 1830 and 1860 who fought in the war, 275 served the Confederacy, while 661 wore the Union blue. From the classes that graduated from 1861 to 1864, only 88 fought for the South (all from the classes of May and June, 1861), while 221 served in the Union Army. Ninety-five graduates were killed in action and another 141 were wounded. Northern politicians, who had been opposed to a military academy all along, seized on the defection to the Confederacy of southern graduates and cadets (and some northern-born graduates, too) to renew their assault on West Point. In addition, the historian James Morrison has pointed out that Radical Republicans attacked the academy on grounds that West Point had a monopoly on high military positions and that graduates discriminated against militiamen and volunteers. Nonetheless, the politicians who were advocates of the academy—and the successful campaigns of its loyal graduates, such as Grant, Sherman, Meade, and Thomas—had put those who had been in opposition to West Point on the defensive, and the academy survived its congressional witch hunts. When the war came

to an end, the principal field armies surrendered at Appomattox Court House, Virginia, and Durham Station, North Carolina. At the former, Robert E. Lee (Class of 1829) surrendered to U.S. Grant (Class of 1843), while at the latter, Joseph E. Johnston (Class of 1829) capitulated to William Tecumseh Sherman (Class of 1840).

In the half century between the end of the Civil War and the start of the Great War in 1914, little had changed in the administration of West Point and the education of its cadets. The feeling among the members of the Academic Board and many of the graduates was that the academy had produced most of the great captains of the Civil War, so it seemed futile to change something that had a proven record of success. The practice of hazing (the harassment and humiliation of plebes) became more severe in those decades, and West Point also began participating in intercollegiate athletics. Eleven of its graduates died in the Plains Indian Wars, five alone at Little Big Horn on June 25, 1876.

As the ex-Confederate states were readmitted to the Union, their citizens were admitted to West Point. In the Class of 1869, there was a cadet from Tennessee whose brother had been a colonel in the Confederate army. That cadet, Samuel E. Tillman, not only graduated but one day would become the academy superintendent. Four graduates (Tom Rosser, Joe Wheeler, Fitzhugh Lee, and Matthew C. Butler) who had served the Confederacy as general officers were reinstated in the U.S. Army as generals—in the spirit of national reconciliation—to lead American troops in the war with Spain in 1898. The first African American cadets likewise were admitted soon after the Civil War, but all were ostracized by the White cadets and few graduated. The first Black cadet to graduate and gain a commission was Henry O. Flipper in 1877. Thirteen African Americans were admitted to the academy between 1865 and 1915, but only three graduated. (During the same period, however, no African Americans were admitted to the United States Naval Academy.) The most notable Black graduate during this era was Colonel Charles D. Young (Class of 1889), although he finished at the bottom of his class. Nonetheless, he served a full career in the army with the so-called Buffalo Soldier regiments and retired during the First World War.

Also to serve with the Buffalo Soldiers was Missourian John J. Pershing (Class of 1886), a

White officer, who during his senior year at West Point had been appointed “Cadet First Captain” (the highest-ranking cadet in the corps). Pershing had distinguished himself as a first lieutenant serving in Cuba with the 10th U.S. Cavalry Regiment, a Black unit, during the Spanish-American War in 1898. As a tactical officer at the academy before that conflict, he was so despised by the Corps of Cadets for his relentless inculcation of discipline that he was given the unflattering nickname of “Nigger Jack”—in reference to his prior service in the 10th Cavalry—which later was softened to “Black Jack” Pershing. It was during the campaign to capture Santiago, Cuba, that the man who organized and coached the first army football team and arranged for the first army-navy football game, Dennis Mahan Michie (Class of 1892), was killed on July 1, 1898, the same day that Teddy Roosevelt and his Roughriders—and Pershing and his Buffalo Soldiers—assaulted San Juan Hill and Kettle Hill. (Today, the USMA football stadium bears Michie’s name.) Although the war with Spain was short and decisive, the conflict to pacify the Filipinos—a result of the acquisition of the Philippine Islands from Spain—was longer and more arduous, not coming to an end until 1902. Nonetheless, many West Point graduates who became generals during World War I gained valuable combat leadership experience against the wily Filipino fighters. The war with Spain, for as short as it was, cost 16 West Point graduates their lives; the Philippine-American conflict saw 22 alumni lay down their lives.

The Early 20th Century

In the years between the Spanish-American War and the U.S. entry into the First World War, many young men who would rise to prominence during the Second World War graduated from the academy, including Douglas MacArthur (Class of 1903), Henry H. “Hap” Arnold (Class of 1907), Simon Bolivar Buckner Jr. (Class of 1908), Jacob L. Devers (Class of 1909), George S. Patton (Class of 1909), Robert Eichelberger (Class of 1909), and Carl Spaatz (Class of 1914). The Class of 1915 has been called “the Class the stars fell on” because 36% of the graduating class became generals, including two who attained five-star rank, Dwight D. Eisenhower and Omar Bradley. When the United States declared war on Imperial Germany on April 6,

1917, the Class of 1917 was graduated in April, a month ahead of schedule, and the Class of 1918 graduated in August 1917. Two classes were graduated early in 1918, although both of those classes returned to West Point to finish their academic training, albeit as student officers instead of as cadets.

The American Expeditionary Forces were under the command of General John J. Pershing, who only recently had led a punitive expedition into Mexico in a futile attempt to capture or kill the cunning Pancho Villa. Pershing now would command the largest American army ever assembled up to that time, and most of its army, corps, and division commanders were USMA graduates: Hunter Liggett (Class of 1879), Charles P. Summerall (Class of 1892), Robert Lee Bullard (Class of 1895), and John L. Hines (Class of 1891), to name only a few. In addition, the U.S. Army Chief of Staff during the war was Peyton C. March (Class of 1888). One of the younger brigade commanders was Brigadier General Douglas MacArthur of the 42nd Division, which itself was commanded by Major General Charles T. Menoher (Class of 1886). At 38, MacArthur was the youngest brigadier general in the army, and his courage under fire earned him two Distinguished Service Crosses and seven Silver Stars. By war’s end, MacArthur himself would command the 42nd Division. During the epic Meuse-Argonne Offensive at the end of the war, Lieutenant Colonel George Patton was wounded on the first day of the campaign, leading his tank battalion on foot after his own tank broke down. Back in the United States, on another battlefield from a different war, Lieutenant Colonel Dwight Eisenhower was relegated to commanding the first training camp for the Tank Corps at Gettysburg, Pennsylvania. Although the American Expeditionary Forces saw only 4.5 months of active, sustained combat, more than 116,000 Americans died, including 24 West Point graduates, all below the rank of lieutenant colonel.

Interwar Years and World War II

West Point underwent a drastic change when Douglas MacArthur became the superintendent in 1919. MacArthur was a reformer. He reinstated the 4-year curriculum that had been suspended due to the early graduations during the war; gave cadets more responsibility and more freedom as well; added

Regular Army officers to the staff and faculty who were not West Point graduates; introduced summer training for cadets at Camp Dix, New Jersey; expanded the athletic program; instituted the Honor Committee; and formally established the Honor Code. None of these changes were welcomed by the Academic Board, and when MacArthur was reassigned to the Philippines in 1922, his successor, Major General Fred Sladen, abolished many of MacArthur's reforms. According to the historian Stephen Ambrose, however, MacArthur had brought a new spirit to the academy and a number of ideas that would eventually become central to the institution. Sladen's successors realized that MacArthur's changes had been necessary and long in coming, and they slowly began to reimplement his reforms. In 1929, the year of the great stock market crash, Washington Hall was completed, the 2,500-seat dining facility where the entire Corps of Cadets simultaneously took their meals. Even as the United States grappled with isolationism while the rest of the world moved toward war, the size of the cadet corps was expanded in 1935 to 1,960 men. One of the graduates of the Class of 1936 was Benjamin O. Davis Jr., an African American who was commissioned as an infantry officer in the still segregated U.S. Army. In 1942, he attended flight training and was transferred to the U.S. Army Air Forces, where he would go on to command the famous Tuskegee Airmen during the war and would retire in 1970 as a lieutenant general in the U.S. Air Force, having become the first Black general in that branch of the service. In 1998, many years after Davis's retirement, President Bill Clinton advanced him in rank to full general.

By 1940, most Americans realized that, sooner or later, the United States would be sucked into another global conflict. That year Major General Robert Eichelberger (Class of 1909) became the academy superintendent and started his own program of reform. He expanded the acreage of West Point to provide the cadets with extensive military training facilities; he de-emphasized horsemanship; he acquired Stewart Airfield in nearby Newburgh, New York, and established an Air Cadet program; and most important, he emphasized military and physical training, and even staged tactical exercises and maneuvers between opposing cadet "Red" and "Blue" forces during summer training. Eichelberger even hired the legendary coach Red Blaik (Class

of 1920) to lead the army football team. When the United States went to war in December 1941, Eichelberger's tenure at West Point quickly came to an end when he was summoned to the Pacific Theater of Operations by Douglas MacArthur, where the former would rise to corps command and four-star rank by the war's end.

During World War II, the academy temporarily adopted a 3-year course of study, with the 4-year curriculum resuming in September 1945. Congress also authorized an expansion of the Corps of Cadets in 1942 from 1,960 to 2,496 cadets, thus filling the dining facility in Washington Hall—still undergoing renovations—to capacity. With wartime expansion, more faculty were required—mostly civilians, retired officers, and even First Classmen (seniors)—as the Regular Army officer faculty were transferred to line units in active theaters of war. Plebes underwent the same style of basic training that army recruits underwent, and cadets in their third year of training spent their summers at active training installations, such as Fort Benning and Fort Knox. The Class of 1944 graduated on June 6—D-Day—with the most visible member being Cadet John S. D. Eisenhower, son of the commander of the Supreme Headquarters, Allied Expeditionary Forces. The war years also saw the ascendancy of army football under Coach Blaik, culminating with three national championships from 1944 through 1946 and back-to-back Heisman Trophy winners, Felix "Doc" Blanchard in 1945 and Glenn Davis in 1946. During the global conflict, West Point lost 487 of its graduates in the European Theater of Operations and an additional 175 in the Pacific, including those who died in Japanese prisoner-of-war facilities. World War II came to a close after two atomic bombs were dropped on Japan; the Manhattan Project responsible for the development of those weapons was directed by Major General Leslie R. Groves, a graduate of the Class of November, 1918. Throughout the war, the names of West Point graduates became household names: MacArthur, Eisenhower, Bradley, Buckner, Arnold, and Patton, to name only a few.

The Cold War

In 1946, Major General Maxwell Taylor (Class of 1922), who had commanded the 101st Airborne Division during the Normandy Invasion as well

as the parachute drop into Holland a few months later, took over as the 40th superintendent of West Point. He quickly reinstated the 4-year curriculum and appointed an academic dean whose position had been authorized by the War Department. In addition, he was able to gain permission to appoint “permanent professor” positions—a senior army officer—for each academic department. These were terminal positions, meaning that the officers would not be transferred to another assignment and could remain at the academy until their retirement, thus bringing stability to their respective departments. Taylor also implemented an enhanced liberal arts curriculum and, at the suggestion of General of the Army Dwight Eisenhower, introduced a course in basic psychology. His tenure would come to an end in 1949, but his skill and deftness in reinstating the 4-year curriculum while introducing needed academic changes at the same time ensured that those changes would not be overturned by the next superintendent. More than a decade later, Taylor finished his military career as the U.S. Army Chief of Staff.

During the Korean War, 157 graduates, mostly young lieutenants, were killed in action or died of wounds. It was the first “hot” conflict of the Cold War, one of several in which the academy graduates were called to serve. Before the official termination of hostilities with the signing of an armistice in 1953, another West Point graduate was elected president of the United States and took the oath of office earlier that year. Dwight David Eisenhower, like Ulysses Grant some 85 years earlier, also was a member of the Republican Party, but the latter’s administration would not be tainted with scandal like the former’s two terms in office. “Ike” Eisenhower’s strategy for the Cold War was called “mutually assured destruction,” employing nuclear weapons against communist aggression (thus diminishing the importance of conventional ground forces) and giving the U.S. Air Force—which became a separate service in 1947—a dominant role in the nation’s defense. On April 1, 1954, the 34th president signed legislation that created the United States Air Force Academy, thus relieving West Point of the obligation of commissioning officers for the newest branch of the U.S. defense establishment. By the end of the decade, the U.S. Army had been reduced to 860,000 soldiers, with the air defense artillery corps being the largest branch of

the service. General Maxwell Taylor, the former superintendant, cautioned the American people and its leaders that the United States was discounting its other potential enemies by overreliance on nuclear “massive retaliation.” A new defense strategy implemented by the next president would not only bring the army back to parity with the air force and the navy, it would reinvigorate the USMA.

In 1960—a presidential election year—Major General William C. Westmoreland, the First Captain of the Class of 1936—became the 45th superintendent. His new commander in chief, President John F. Kennedy was, like Westmoreland, a combat veteran of the Second World War, having commanded a PT boat in the Pacific Theater. Kennedy’s answer to the Cold War was called “Flexible Response,” a strategy that called for a potent nuclear arsenal, a strong conventional force, and special operations forces that could battle communist insurgencies around the globe—in other words, a defense force capable of fighting across a wide spectrum of warfare. The USMA thus would have to adjust its training to prepare its graduates to fight these types of conflicts—something that the young president had challenged its leaders to do when he gave the commencement address for the Class of 1962. Although there would be little change in the curriculum (the previous superintendant at least had convinced the Academic Board to allow the cadets to take two elective courses), the military training was modernized to reflect the army’s new mission of counterinsurgency warfare against communist guerrillas, especially those then operating in South Vietnam. Maxwell Taylor was appointed ambassador to that country in 1963, and in 1964 William Westmoreland became the commanding general of MACV—Military Assistance Command, Vietnam—and remained in that position until 1968 when he became the U.S. Army Chief of Staff. Ultimately, the United States fought a losing battle in Southeast Asia, and the U.S. military—and West Point—would lose some of its luster as a result.

During America’s longest war—to that time—some 273 USMA graduates were killed in action, died of wounds, or were missing in action and declared dead. Nonetheless, West Point’s prestige had been sullied by the fact that the United States, for the first time, had lost a war. To make matters worse, a new crop of West Point critics surfaced, the most influential of which was Lieutenant Colonel

Anthony Herbert, a non-West Pointer who wrote a scathing indictment of the academy and its graduates in a book titled *Soldier* based on his experiences with West Point graduates—what he called the WPPA, or “West Point Protection Association”—with whom he had served in South Vietnam. Other critics made similar complaints, arguing that “careerism” among West Point graduates contributed to the American defeat in Southeast Asia. To make matters worse, General Samuel Koster, the academy superintendent from 1969 to 1970, was forced to resign after it was determined that he had been involved in the 1968 My Lai massacre and attempted cover-up. Despite these problems, it should be noted that during the Vietnam War, five West Point graduates earned the Medal of Honor.

The year 1976 marked both a time of momentous shame and revolutionary change. That year—the nation’s bicentennial—a cheating scandal on an electrical engineering test (known as a “written partial review” or “WPR” in West Point vernacular), rocked the academy. It also was the year that West Point admitted females for the first time in its history. Of the 192 women who took the oath of allegiance in July 1976, 62 graduated in May 1980. The Class of 1980 also included Cadet Vincent Brooks, the first African American to be appointed First Captain of the Corps of Cadets, and who, many years later, would rise to general officer rank. Two years later, West Point underwent another drastic alteration when the curriculum was changed to allow cadets to choose academic majors in the heretofore engineering- and mathematics-based program of study.

In contrast to the struggle of integrating women at Virginia Military Institute and the Citadel, West Point officially embraced women with less turmoil. Moreover, the admittance of women in the ranks also saw the appointment of women faculty members for the first time. At the same time, women cadets faced significant barriers. Although women in most elite private universities and college make up more than 50% of the student body, they remain a distinct minority at West Point with their numbers reaching 20% of the Corps of Cadets. Student culture at the academy witnessed frequent incidents of harassment of women cadets based on their gender, as well as high rates of sexual violence that often went unreported to authorities. Despite these

obstacles, women cadets have distinguished themselves in the classroom and athletic fields, going on to serve with distinction in the conflicts in Iraq and Afghanistan.

More change followed during the reign of Lieutenant General Dave Palmer’s tour of duty as superintendent. A 1956 West Point graduate, Vietnam veteran, and former instructor in the USMA History Department, Palmer brought both a sense of transformation and “historical mindedness” to the academy. He overhauled the “Fourth-Class System” to make it more like the training and discipline that recruits undergo in the Regular Army, while still emphasizing the heritage of the academy and West Point proper. Under Palmer’s leadership, the Corps of Cadets also saw its first female become first captain when Kristin Baker (Class of 1991) assumed that position in 1990. During the 1980s and early 1990s, the army football team also experienced resurgence, garnering three bowl appearances under the leadership of coaches Jim Young and Bob Sutton.

West Point in the Wars in Iraq and Afghanistan

When Saddam Hussein invaded Kuwait in 1990, the U.S. Army got the first real test of its capabilities since the Vietnam War. As the buildup of allied military forces in Saudi Arabia continued into January 1991, some members of the staff and faculty at West Point were transferred to fill slots in units that had deployed to the war zone, and recent graduates led their platoons and companies in anticipation of what every pundit believed would be a bloody war. What followed was a short, overwhelming allied victory led by the coalition commander, General Norman Schwarzkopf (Class of 1956). One West Point graduate perished in what has come to be called the Persian Gulf War but at the time was known as Operation Desert Storm.

With the disintegration of the Soviet Union and the end of the Cold War, the U.S. military was downsized in a drastic fashion, and many officers from the graduating classes of the late 1980s and 1990s served their 5-year obligation and sought opportunities in the business world. Then came September 11, 2001, followed by the Iraq War. Graduates of West Point were again called up for combat leadership

roles, and many already have made the ultimate sacrifice, including two women graduates, 1st Lieutenant Laura Walker (Class of 2003) and 2nd Lieutenant Emily J. T. Perez (Class of 2005).

West Point graduates have not only served their country in times of war but also provided valuable service in the civilian sector. "The Long Gray Line" includes two U.S. presidents (Grant and Eisenhower); the man credited with building the Panama Canal (George W. Goethals, Class of 1880); the first man to walk in space (Edward H. White, Class of 1952) and 17 other astronauts; one of the great college basketball coaches of all time (Mike Krzyzewski, Class of 1969); the president of the 7-Eleven convenience store chain (Joe DePinto, Class of 1986); numerous U.S. senators, congressmen, ambassadors, and cabinet officials; and even nongraduates Edgar Allan Poe and James Whistler.

U.S. NAVAL ACADEMY

The United States Naval Academy (USNA) is a 4-year institution of higher learning that serves to prepare officers for the U.S. Navy and the U.S. Marine Corps. The academy has as its mission

to develop Midshipmen [USNA's students] morally, mentally, and physically, and to imbue them with the highest ideals of duty, honor, and loyalty in order to graduate leaders who are dedicated to a career of naval service and have potential for future development in mind and character to assume the highest responsibilities of command, citizenship, and government.

Located along several tributaries of the Chesapeake Bay in Annapolis, Maryland, USNA's physical plant supports the academy's mission and includes academic departments; physical training, religious, administrative, and medical facilities; a football stadium and other athletic facilities; numerous military support buildings; and a massive dormitory, Bancroft Hall, that houses and feeds the entire student body of 4,600. USNA had an operating budget of \$130 million in 2010.

Born of a desire to improve on the Navy's education of its personnel, USNA's roots lie with William Chauvenet, a teacher at one of the Navy's several short-term training schools. In 1843, Chauvenet devised a plan for one, formal, centralized educational institution. Two years later, Secretary of the Navy George Bancroft, interested in Chauvenet's idea, worked with him and Navy leader Franklin Buchanan to devise such an institution, the Naval School, which Bancroft located at the Army's Fort Severn at the entrance to the Annapolis harbor. Wishing to improve on their design, the men reorganized the Naval School, with academic departments and focused military and seamanship education,

United States Naval Academy's Bancroft Hall, ca. 1920.

and on July 1, 1850, renamed it the United States Naval Academy. By 1870, athletics, formal graduation ceremonies, and attention to issues of personal honor became permanent fixtures of USNA. It was the 1890 publication of *The Influence of Sea Power Upon History*, by the USNA alumnus Alfred Thayer Mahan (Class of 1859), that brought unprecedented congressional funding for the U.S. Navy and led to the modernization of the academy's campus. The architect Ernest Flagg redesigned USNA in 1897 with a dormitory named for Bancroft, a large chapel housing the crypt of the Revolutionary War naval leader John Paul Jones, and academic buildings, all in the Beaux Arts style and all built around a green campus and a boat basin. Most of the subsequent buildings added to USNA have followed Flagg's vision. USNA has remained in Annapolis with the

exception of the Civil War period, when it operated in Newport, Rhode Island. USNA's presence in Newport, however, has endured in the form of the USNA Preparatory School, which serves to bring candidates up to the academy's entrance standards.

Midshipmen hail from all U.S. states and territories, and they apply to USNA through a system of application common to other federal service academies, including interviews and politicians' nominations. USNA's admission board studies candidates thoroughly and strives to create an entering class that simultaneously meets the manpower needs of the Navy and the Marine Corps; represents a variety of educational accomplishments, extra-curricular activities, and leadership experiences; and mirrors the ethnic and racial background of

the U.S. citizenry at large. The federal government authorized women's attendance at service academies in 1975, and since the first women graduated in the Class of 1980, their numbers have increased steadily. Since 2007, women have constituted more than 20% of the brigade of midshipmen, or student body. Similarly, the percentage of students USNA identifies as minorities has increased dramatically from 18% of the brigade in 2000 to more than 30%, the highest level in academy history, in 2010.

Midshipmen begin their experience at USNA as plebes, or freshmen, during the plebe summer, an intense period of physical activities and military indoctrination that precedes their initial fall semester. Plebes study a handbook, titled *Reef Points*, that covers the Naval Academy's history, organization, culture, traditions, and honor concept. The honor concept is a moral guide that Midshipman William Lawrence (Class of 1951), as the brigade commander, or highest class leader, helped formulate. The honor concept includes a flexible counseling option to help midshipmen learn from their mistakes. During the course of their 4 years, midshipmen take courses in a core curriculum that focuses on engineering and science, and they choose a major from among 21 disciplines within the academic divisions of engineering and weapons, humanities and social sciences, and mathematics and science. They also receive formal training in officer development and professional development, emphasizing leadership and ethics, as part of their moral education. The USNA Center for Academic Excellence, founded in 1989, provides midshipmen with academic counseling and tutorial services. USNA's faculty consists of professional civilian academics, almost all of whom have PhDs and tenure, and military faculty, who serve 2- to 3-year tours teaching at USNA. In 2010, USNA had a total of 525 faculty members, of whom 306 were civilians and 219 were military personnel. Assisting the faculty and midshipmen with their academic pursuits is a modern library staffed with trained research librarians.

Another major focus of USNA's preparation of midshipmen is on athletic, physical, and military training. The Naval Academy is a member of the National Collegiate Athletic Association, Division 1, and fields varsity teams in 17 men's sports, 9 women's sports, and 4 coed sports, and club teams in 4 men's sports, 2 women's sports, and 6 coed sports. More than 100 coaches, trainers, and athletic specialists

assist midshipmen in their athletic and physical training pursuits. Perhaps the most notable event each school year is the army/navy football game, usually in early December, with activities focused on the friendly rivalry with the United States Military Academy. Midshipmen also practice military bearing and marching and train with different navy and marine units during the summers between academic years to determine which service communities they will enter for their military careers on graduation. Generally one sixth of each graduating class may enter the Marine Corps as 2nd lieutenants, with the majority of the remainder of the graduates becoming ensigns in the navy. Between 1949 and 1963, many midshipmen chose commissions in the U.S. Air Force, but at present, only a few graduates choose commissions in the air force or the army each year. All midshipmen graduate with a bachelor of science degree, and nearly all graduates enter post-USNA training focused on the military career path they have chosen.

Tempering the intensity of their academic and physical activities, midshipmen can choose from among 85 extracurricular activities. Participation is widespread in these organizations, which USNA categorizes as musical/theatrical, spirit, religious, competitive, recreational, professional, community service, publications, heritage, and academic. Among the longest lived of these is *The LOG* magazine, which for much of the century of its history has reported on athletics, news, and satire, most vividly in the "Salty Sam" column in which a fictionalized character recounts humorous stories about midshipman life. Religion is significant for many midshipmen, and a small group of military chaplains supervises religious activities at USNA's prayer spaces at the Naval Academy Chapel, the Uriah P. Levy Center and Jewish Chapel, and the Chaplain's Center. Many midshipmen, particularly those in underrepresented groups like women and African Americans, find community and an opportunity to discuss common challenges in organizations such as the Joy Bright Hancock Group for women, the Midshipmen Black Studies Group, and six other ethnic group-based clubs. Midshipmen also receive support from Sponsor Parents, a network of families in the Annapolis area who welcome USNA students informally into their homes, and from the extensive staff of food and housekeeping workers, medical personnel, and other

USNA staff who offer assistance to members of the brigade.

Naval Academy alumni have participated in every American military conflict since the first midshipmen graduated in 1854. Many of those graduates' accomplishments are memorialized throughout the USNA campus, including in street names, on plaques describing the courage of the 73 USNA alumni who were Medal of Honor recipients, and with monuments and statues such as the one honoring James Stockdale, a 1947 graduate who was a prisoner of war in Vietnam and later became a Navy vice admiral. The names of notable USNA alumni adorn the campus's buildings, including Michelson Hall, honoring the famed physicist Albert Michelson (Class of 1873) who did his initial studies on the speed of light while an instructor at USNA in 1877; Rickover Hall, honoring the nuclear Navy proponent Hyman Rickover (Class of 1921); and the Wesley Brown Field House, honoring the first African American graduate of USNA (Class of 1949). The Navy's major role in World War II, particularly in the Pacific Theater, led to the inscription of names, on USNA buildings and monuments, of alumni who played significant roles in the conflict, including William Halsey Jr. (Class of 1904), Ernest King (Class of 1901), Marc Mitscher (Class of 1910), and Chester Nimitz (Class of 1905). The Navy-Marine Corps Memorial Stadium bears the names of major 20th-century battles in which USNA alumni have fought. In 2010, approximately 14,000 of USNA's 77,000 living alumni were serving in Iraq, Afghanistan, and at other duty stations around the world and in the United States. Many USNA alumni have also had significant national political careers, including President Jimmy Carter (Class of 1947) and the Arizona senator John McCain (Class of 1958).

At the helm of USNA are two high-ranking officers, the superintendent, who serves as the equivalent of a university president, and the commandant, who serves as the equivalent of a university's provost and dean of students. These military officers have brought to USNA many different styles of leadership of the institution and the brigade and have focused on such issues as academics, honor, ethics, respect, and accountability during their terms, oftentimes in response to challenges that have arisen at USNA or that American society has presented. Although all USNA superintendents have been White, male, and

navy officers, there has been greater diversity among the academy's commandants. They have included John Allen (Class of 1976), 2002–2003, the first marine to serve as commandant; Bruce Grooms (Class of 1980), 2005–2006, the first African American to serve as commandant; and Margaret Klein (Class of 1981), 2006–2008, the first woman to serve as commandant.

The National Park Service recognized USNA as a national historic landmark in 1961 for its architecture and for the academy's long role in preparing leaders for the nation. Because the campus is physically entwined with the historic district and sailing center of the city of Annapolis, midshipmen have the opportunity to interact with the community and its tourists and have access to the cultural and recreational opportunities of the nearby Baltimore/Washington, D.C., area. USNA itself is a major tourist destination, and its visitor center offers daily tours of the academy. In addition to the many monuments and memorials around the campus, areas of interest include the U.S. Naval Academy Museum and the public areas of Bancroft Hall, which feature objects related to navy and Marine Corps history, and the cemetery and columbarium, which include 6.7 acres of graves of men and women who were on active duty at USNA, Medal of Honor recipients, employees, faculty, and alumni of USNA, and midshipmen who died before graduating from the Naval Academy.

U.S. NAVAL INSTITUTE

Based at the United States Naval Academy in Annapolis, Maryland, since its 1873 founding, the U.S. Naval Institute (USNI) is a nonprofit, professional military association whose mission, according to its website, is “to provide an independent forum for those who dare to read, think, speak, and write in order to advance the professional, literary, and scientific understanding of sea power and other issues critical to national defense.” It supports the professional development of naval officers through its journal *Proceedings*, book publishing, and sponsoring lectures, seminars, and conferences. Unlike many similar organizations, which are sponsored by national governments or particular branches of the military, the USNI is a private organization, and this has allowed its members more freedom to challenge established policy. It became a central forum for discussions of naval matters and attracted members from around the world in addition to its core constituency of U.S. naval officers. This entry discusses the creation and mission of the USNI and examines its most well-known publication, the journal *Proceedings*.

On October 9, 1873, a dozen naval officers and several civilian Naval Academy professors founded the USNI to provide a forum for discussions of naval history, strategy, policy, and maritime issues to further the “professional, literary, and scientific knowledge in the Navy.” They were inspired by similar organizations in Europe, particularly Britain’s Royal United Service Institute, and the Navy Lyceum, which had sponsored lectures and discussions of naval issues before the Civil War. Frustrated by the growing technological and material gaps between the U.S. Navy and foreign navies, the USNI’s founders hoped to inspire and lead the modernization of the fleet and reform its administration. The USNI’s creation reflected officers’ changing views of themselves, their profession, the navy, and the place of the United States in the world.

Spurred by Commanders Alfred Thayer Mahan and William T. Sampson, the USNI launched its journal, *Proceedings*, in 1874. It became a forum for discussion and often fierce debates on tactics, strategy, naval administration, fleet composition, and the navy’s mission. It attracted essays from the navy’s senior officers and many of its most promising young officers and leading intellectuals. Common themes included the benefits of maritime supremacy (and how to achieve it), the advantages of a canal through the Isthmus of Panama, new technology (and its naval applications), and pleas to revive the American merchant marine. *Proceedings*’s essays discussed the construction and tactical use of torpedoes and torpedo boats, submarines, battleships, and later aircraft. Along with these, it published a host of articles on practical subjects, such as engines and navigation, and discussions of famous naval campaigns and battles and other topics of historical interest. In 1879, the *Proceedings* launched an annual prize essay to further stimulate professional thought, and USNI leaders chose topics of immediate interest to naval modernization as part of a determined effort to transform the navy.

Essays in the *Proceedings* sparked the creation of many of the key institutions of the new, turn-of-the-century navy, which USNI members staffed in disproportionate numbers. In 1883, for example, founding member Stephen B. Luce published an essay advocating the higher education of naval officers, which in turn sparked the creation of the Naval War College, most of whose early faculty members were also prominent members of the USNI, who had themselves published essays in the *Proceedings*. USNI members also occupied key roles in the new Office of Naval Intelligence and the naval advisory boards and other special commissions that guided the navy’s development in the late 19th and early 20th centuries. Articles proposing a naval reserve, for example, led first to federal recognition of state naval militias in 1891 and then the Naval Reserve Acts of 1915 and 1916.

Many *Proceedings* articles in the 1920s and 1930s anticipated developments in World War II, and discussions of aviation won the prize essay contest in 1925, 1931, 1940, and 1943. Many of the navy’s senior World War II leadership had published essays in the *Proceedings*; among them was Ernest J. King, who won the 1909 prize essay for a discussion of shipboard organization. After the war, topics

expanded to include nuclear weapons, limited war, and containment. Later articles explored the navy's role after the Cold War.

The USNI began publishing books in 1899, focusing on practical and technical subjects, such as navigation, seamanship, international and maritime law, and guidebooks for officers and sailors, such as the *Bluejacket's Manual* (1902). It published many textbooks required by the Naval Academy and added a growing number of historical titles over time. After World War II, it published a growing number of books aimed at a popular audience, including Tom Clancy's best-selling *Hunt for Red October* and other novels. In 1987, it launched *Naval History*, a popular magazine aimed at the general public.

The *Proceedings* launched a photography contest in the 1920s, and the USNI developed an extensive collection of more than 400,000 historic photographs. Essay contests for the enlisted ranks (1948) and naval academy midshipmen (1954) joined the annual prize essay, which continued to showcase the navy's best minds. In 1969, it assumed the oral history program begun by the noted historian Allan Nevins and has since amassed several hundred interviews of senior officers, including Admirals Arleigh Burke and Chester Nimitz.

In recent years, secretaries of the navy and senior admirals have often used the *Proceedings* as a forum to present their views, particularly Secretary of the Navy John Lehman, who trumpeted the need for a 600-ship navy in the 1980s, and Admiral Arthur Cebrowski, who articulated the concept of network-centric warfare in 2001. Nonetheless, the *Proceedings* remains intellectually vibrant and a central forum of professional thought. The USNI has grown to 65,000 members, many of them current or former members of the U.S. Navy, Marine Corps, and Coast Guard, and it continues to expand its book publishing and oral history collection.

U.S. NORTHERN COMMAND

In the wake of the terror attacks of September 11, 2001, the national government of the United States advanced the idea of reorganizing the Department of Defense's Unified Command Plan to include a new joint command with the responsibility for providing defense of the homeland against terrorism and transnational criminal activities. This new command—Northern Command (NORTHCOM)—was established in April 2002 and became operational on October 1, 2002, with headquarters at Peterson Air Force Base, Colorado. The commander of the new organization would also have command responsibilities for the North American Aerospace Defense Command, a long established binational command operated in conjunction with Canadian Defense Forces, with air defense responsibilities for North America.

The command takes guidance from the National Response Framework and Joint Publications 3-26 (Counterterrorism) and 3-28 (Civilian Support). The joint publications establish doctrine by which the command operates.

The mission of NORTHCOM is to conduct homeland defense, civil support, and security cooperation to defend and secure the United States and its interests. Its area of operation includes the continental United States, Alaska, Canada, Mexico, and the surrounding waters out to 500 miles off shore. This area of operation also includes the Gulf of Mexico, the Straits of Florida portions of the Caribbean region to include the Bahamas, Puerto Rico, and the U.S. Virgin Islands.

Though the mission of NORTHCOM is wide ranging, the command has relatively few organic forces. Its component commands provide forces as they are needed. This arrangement proved problematic in the first decade of Northern Command's existence due to the high operational tempo of forces

engaged in wars in Afghanistan and Iraq. Similarly, as the National Guard is the major federal force provider, conflicts often arise concerning authority over these forces when civil support is needed. Governors command National Guard forces under Title 32 when forces are deployed to support state operations. Under federal activation (Title 10), the Commander of NORTHCOM would retain command authority. This tension has not been fully mediated and has often led to difficulties, particularly when forces are being deployed to support disaster relief.

The command is currently organized around the joint task force model. At present, there are four joint task forces, along with component commands, found on the NORTHCOM's organizational chart. Joint Task Force-National Capital Region (JTF-NCR) is headquartered at Fort McNair in the Washington, D.C., area. Because of the critical nature of the National Capital Region, this command element is in place to provide homeland defense and support to civilian authorities in the area. An important function of this task force is its role in events of national significance. With proximity to the national command authority, the NORTHCOM elements can coordinate activities for all military elements supporting civilian response and recovery actions.

The second JTF is assigned responsibilities for Alaska—JTF-AK. This headquarters has the responsibility of coordinating all military support to civilian authority to protect national interests in Alaska.

The JTF with perhaps the most difficult mission in NORTHCOM is the one with civil support (JTF-CS) responsibilities. The JTF-CS, headquartered at Fort Monroe in Virginia, has the primary role of providing capabilities for detecting and combating chemical, biological, radiological, nuclear, and high-yield explosive consequence management operations. There are 55 civilian support teams organized across the country to provide immediate response when chemical, biological, radiological, nuclear, and high-yield explosive weaponry is thought to be in play. As nearly all mitigation capability is found in the military, this task force performs a critical mission in the defense of the nation against weapons of mass destruction.

The fourth element is JTF-North (JTF-N). This is the oldest legacy organization, with responsibilities that extend across our southern border. Its mission is to support federal law enforcement agencies against

transnational threats. Headquartered at Fort Bliss, Texas, the task force plays a critical role in the War on Drugs and in supporting counter- and antiterror activities in the border region.

The command has a difficult situation with which it must deal. There have long been tensions between civilian and military authorities, particularly when the doctrine of *Posse Comitatus* has come into question. The military is prohibited by federal statute from taking part in civilian law enforcement activities. Though the doctrine has been waived numerous times during our history, it remains a major inhibitor in times of crisis.

Perhaps the most difficult task in fulfilling its mission is the ambiguity that exists concerning what civilian authorities might need from the military establishment. Though NORTHCOM can provide nearly anything within the control of the military, without knowing what might be needed makes coordination and support problematic. Furthermore, determining when NORTHCOM forces are needed in times of crisis has been difficult as well. Add to this situation the paucity of forces available with two wars ongoing, and NORTHCOM is often stretched very thin.

A recent Government Accountability Office report highlighted challenges for NORTHCOM that must be overcome if the command is to fulfill its mission responsibilities. First, the command has not been successful in gaining support information from the Department of Homeland Security. As the focus of the military command is on military forces and actions, integrating with civilian authorities has presented difficulties. The Department of Homeland Security has been in existence for less time than NORTHCOM, so cultural and institutional issues have inhibited operations. A second challenge has been developing contingency plans if NORTHCOM cannot provide forces to support civilian operations. Though the United States will not likely be at war for extended periods of time, current operations have lasted nearly 10 years, placing NORTHCOM capabilities at risk. Finally, the command has not fully established a readiness measurement system. Given the ambiguity of forces available, this challenge may be difficult for the command to overcome.

The U.S. Northern Command is likely at a crossroads in its existence with resources constrained at all levels, particularly at the state and local government

level. Similarly, current economic conditions at the national level will force Department of Defense planners to take a hard look at force structure and resource allocations for all joint commands. Until such time as the 39,000 civilian governmental jurisdictions can mount a cohesive national preparedness capability, the forces of NORTHCOM will be needed.

U.S. PACIFIC COMMAND

The U.S. Pacific Command (USPACOM) is one of six combatant commands of the U.S. military. It is composed of the U.S. Pacific Fleet, U.S. Pacific Air Forces, U.S. Army Pacific, and U.S. Marine Forces, Pacific. USPACOM's area of responsibility (AOR) is the largest for any unified combatant command, stretching from the west coast of the United States to the western border of India and from Antarctica to the Arctic pole. The commander of USPACOM is the most senior American military official in the Pacific region and answers to the president of the United States through the office of the secretary of defense and the Joint Chiefs of Staff. USPACOM is headquartered in Hawaii and is currently headed by Admiral Samuel J. Locklear III.

Force Makeup of USPACOM

As of 2012, USPACOM forces numbered approximately 325,000, or roughly 20% of all active U.S. military forces. The heart of USPACOM is the U.S. Pacific Fleet. The fleet comprises six aircraft carrier

strike groups numbering approximately 180 ships, 1,500 aircraft, and 100,000 personnel. The Pacific Fleet is divided between the Third Fleet, stationed in California, and the Seventh Fleet, stationed in Japan and is supported by eight destroyer squadrons. Marine Forces, Pacific, contains two thirds of the Marine Corps's offensive capabilities, comprising the 1st and 3rd Marine Expeditionary Forces, numbering roughly 85,000 personnel. U.S. Pacific Air Forces comprises roughly 400 aircraft, with 100 of those stationed at Guam, along with approximately 40,000 personnel. Organizationally, U.S. Pacific Air Forces is divided into four air force groups. The Fifth Air Force is stationed in Japan, the Seventh in Korea, the Eleventh in Alaska, and the Thirteenth in Hawaii. U.S. Army Pacific personnel number roughly 60,000 and include five Stryker brigades for rapid deployment and projection of American ground power around the Pacific region. Army forces are divided between Alaska, Hawaii, and Japan, with U.S. Army forces in South Korea falling under the purview of the Eighth U.S. Army.

History of USPACOM

President Harry S. Truman created USPACOM on January 1, 1947, to consolidate and coordinate American military personnel and effort in what had formerly been the Pacific Theater of World War II. Admiral John H. Towers served as the first commander in chief of the Pacific Command. This designation was changed in 2002 to the title of combatant commander to clarify the idea of civilian control over the military services, since the president serves as the only commander in chief of the U.S. military. This date of establishment marks USPACOM as the oldest of the six unified combatant commands in the U.S. military. Prior to 1958, the U.S. Pacific Fleet was under the command umbrella of USPACOM but was designated as a separate entity starting in that year with its own command structure.

Over the course of its existence, USPACOM has grown steadily as it has absorbed various area commands that have been shut down. In 1957, USPACOM absorbed the Far East Command, which was established the same year as USPACOM. In 1972, USPACOM's AOR was expanded with the inclusion of the Indian Ocean basin, southern Asia, and the Arctic as well as incorporating Alaska

Command, which was disestablished that year. Four years later, its AOR was expanded to cover the area of the Indian Ocean up to the eastern coast of Africa, resulting in USPACOM being responsible for an area of more than 100 million square miles. Under President Ronald Reagan, USPACOM responsibilities were once again expanded as China and portions of Asia, including Mongolia and North Korea, were added to the command's region.

The organizational structure of USPACOM was overhauled with the passage of the Goldwater-Nichols Act of 1986 that provided for the most sweeping changes to the U.S. defense structure since the passage of the National Security Act of 1947. Under Goldwater-Nichols, interservice rivalries, which had been a major cause of consternation to American defense planners since World War II, were lessened as the chain of command between the president and unified combatant commanders was streamlined. Prior to Goldwater-Nichols, unified combatant commanders reported to their designated service chiefs who in turn reported to the secretary of defense and then the president. This tended to promote interservice friction as each military branch sought to maximize its own position in budgeting and influence. This lack of coordination also made it difficult for the United States to create an integrated military doctrine that balanced all aspects of the military. Goldwater-Nichols also provided for greater sharing of weapons technology between the branches, which prevented a repeat of the 1950s nuclear weapons development race that occurred between the army, the navy, and the air force.

Starting in the late 1980s, the trend of USPACOM's AOR increasing began to reverse itself as shifts within the American defense structure provided for a shrinking of the AOR. In 1989, a new Alaska Command was established that was made subordinate to, though separate from, USPACOM. That same year, responsibility for regions of the Middle East, including the Gulf of Aden and the Gulf of Oman, was placed under the direction of U.S. Central Command, and in 1996, the area surrounding the Seychelles was also transferred to Central Command. In 2000, it was decided that the eastern coast of Africa would be shifted from USPACOM to U.S. European Command. These steps were undertaken to help lessen the strain on

USPACOM resources and to help more clearly define borders between USPACOM and its fellow unified combatant commands.

In the aftermath of the terrorist attacks of September 11, 2001, USPACOM once again saw its AOR shifted as the U.S. military structure underwent an overhaul in response to the attacks. A new U.S. Northern Command was established to oversee homeland defense. Alaska command was transferred to U.S. Northern Command, but its combat forces stayed under the command of USPACOM. In 2008, a significant area of territory in the Indian Ocean was removed from USPACOM's purview and turned over to the newly created U.S. Africa Command. This marked the last major overhaul of USPACOM's borders and finalized the current six unified combatant commands areas of responsibility.

Major Exercises

USPACOM is responsible for fulfilling several major defensive alliances with major U.S. partners, including with Australia, the Philippines, Japan, and South Korea. Every 2 years in odd-numbered years, USPACOM participates in Operation Talisman Saber, a major training exercise undertaken with the Australian military. This exercise serves as the main training venue for the U.S. Seventh Fleet. Similar training exercises are held between USPACOM and the military of Thailand (Cobra Gold), the Philippines (Balikatan), and with the Self-Defense Forces of Japan (Keen Sword/Keen Edge). Arguably, the most important exercise undertaken by USPACOM is the biennial Rim of the Pacific (RIMPAC) that occurs in even-numbered years.

RIMPAC is the world's largest maritime military exercises. First held in 1971, RIMPAC serves as a venue for Pacific nations to promote stability in the region but has also increasingly taken on greater importance as the threat of several points of contention in the Pacific region, including continued strained relations between China and Taiwan, and North Korea and South Korea, has increased. The last RIMPAC exercises were held in 2012, with USPACOM forces being represented by the USS *Nimitz* and other elements of Carrier Strike Group 11. Twenty-two nations participated in the 2012

exercises, and these exercises marked the first time that Russian forces had participated.

Apart from training exercises, USPACOM has served an important role in humanitarian missions throughout the Pacific region in response to several major natural disasters. Since 1996, USPACOM has participated in 20 such missions operating in 12 different countries. The largest of these humanitarian missions was launched in response to the December 2004 tsunami that ravaged large sections of Southeast Asia, leaving nearly 300,000 people dead and more than 1 million displaced throughout 11 countries in the region. At the high point of American involvement in the relief efforts, USPACOM had dispatched nearly 16,000 personnel, 24 ships including Carrier Strike Group Nine, and more than 100 aircraft. In 2008, USPACOM forces took part in the international relief effort for Burma in the aftermath of Cyclone Nargis. In 2011, USPACOM responded to the earthquake and tsunami that hit northeastern Japan with Operation Tomodachi. This effort involved almost all possible USPACOM forces located in and near Japan, eventually resulting in an American effort totaling 24,000 personnel, 24 navy vessels, and almost 200 aircraft.

USPACOM has taken on an increasing importance with the decision of the administration of President Barack Obama to shift American military focus away from Europe to the Pacific region. This has led to a planned increase in the American military presence in the region, including the stationing of U.S. Marine forces in northern Australia. Much of the increased focus on the Pacific has been in response to America's regional partners' concerns over the growing military influence of China in the region as well as long-standing tensions with North Korea. Generally, American defense planners have maintained that North Korea remains the predominant military focus for USPACOM, but increasing tensions between China and the Philippines over the Scarborough Shoal in the South China Sea and between China and Japan over the Daiyou Islands in the East China Sea continue to weigh heavily on the minds of military planners working in the Pacific region.

U.S. SOUTHERN COMMAND

The U.S. Southern Command (SOUTHCOM) staff is organized into directorates and security cooperation organizations. SOUTHCOM comprises more than 1,200 military and civilian personnel representing the army, navy, air force, Marine Corps, Coast Guard, and other federal agencies. The armed services provide SOUTHCOM with the following component commands: U.S. Army South, U.S. Air Forces Southern, U.S. Naval Forces Southern Command/U.S. Fourth Fleet, and U.S. Marine Corps South. The SOUTHCOM enterprise also includes Command South, Joint Task Forces Guantanamo and Bravo, one Joint Interagency Task Force, and a network of Security Cooperation Offices. Combatant command authority is exercised through the commanders of SOUTHCOM's different components. The SOUTHCOM commander reports to the president of the United States through the secretary of defense.

SOUTHCOM is one of nine unified combatant commands within the Department of Defense. It is responsible for U.S. military operations and security assistance programs in South America, Central America, and the Caribbean. It originated from the Caribbean Defense Command (CDC), a prototype military structure created during World War II. From 1941 to 1947, an army two-star general commanded the CDC from Quarry Heights, Canal Zone. The CDC primarily defended the Panama Canal and Caribbean Sea lanes but also developed counterespionage and antisubmarine missions to ensure defense of the region. Latin American governments were aided by the CDC through military training missions, admittance of Latin American

soldiers to U.S. service schools, and disbursing Lend-Lease materials to Latin American partners. The European and Pacific theaters were assigned the majority of U.S. military personnel during World War II, but there were 130,000 uniformed personnel spread out across Latin America and the Caribbean.

Following World War II, the Joint Chiefs of Staff reorganized military commands to promote interservice cooperation. The Joint Chiefs of Staff unified the armed forces under the administration of Harry S. Truman and broke military commands into geographic regions. The conduct of all military operations, regardless of force type, was placed under the leadership of that region's lone commander. The CDC was deactivated in 1948 and replaced by the unified Caribbean Command, then commanded by a three-star general. The Caribbean Command still defended the Panama Canal, but now it is the American representative for security cooperation in Central and South America. It also oversaw the administration of military assistance programs in Mexico and the Caribbean.

Defense strategists removed the Caribbean basin from the Caribbean Command's area of responsibility (AOR) as the Cold War became hotter. It was thought that U.S. Atlantic Command in Norfolk was best suited to defend the hemisphere from this area. This change in boundaries held into the 1960s and the Caribbean Command remained unengaged in the Caribbean. President John F. Kennedy's administration redesignated the Caribbean Command as U.S. SOUTHCOM on June 6, 1963, to reflect a more accurate name. This transformation established a four-star billet for commander and shrank the command's AOR to the noninsular landmass of Latin America. SOUTHCOM continued to protect the Panama Canal, made contingency plans for Cold War activities, and was the face of the U.S. military throughout the AOR.

From 1972 to 1983, SOUTHCOM dramatically reduced and restructured its mission because of the Panama Canal treaty negotiations, the East-West détente, and political pressure to reduce the size of U.S. overseas military commands following Vietnam. The command was reduced to a three-star billet and was primarily relegated to emergency evacuations/disaster relief. Communist advances in Central America, increased drug trafficking, arms smuggling, and Panamanian militarism caused the Department of Defense to restore SOUTHCOM's

mission in 1983. The Reagan administration oversaw much of the reemphasis on SOUTHCOM. It was restored to a four-star command and began contingency planning for low-intensity conflicts and counterdrug operations.

The collapse of the Soviet Union in 1991 altered the geopolitical environment and caused SOUTHCOM to change again. The AOR underwent a period of relative stability, and democracy appeared to be strengthening. Still, the trafficking of drugs, arms, and illegal migrants continued to escalate. Additionally, political crises in Ecuador, Paraguay, Colombia, Venezuela, Peru, and Haiti weighed heavily on the command. Counterdrug operations, peacekeeping missions, humanitarian assistance, and security assistance operations all increased for SOUTHCOM from 1991 to 2001. In 1997, SOUTHCOM's headquarters was moved from Quarry Heights, Panama, to Miami, Florida, and the Caribbean Basin was returned to its AOR. This allowed the command to lessen its focus on keeping U.S. personnel safe in the Canal Zone. The terrorist attacks on September 11, 2001, initiated a period of geopolitical uncertainty and affected the SOUTHCOM's mission. Illicit trafficking in drugs, ethno-nationalist and populist movements, and changes in global terrorism began to weaken the relations that the United States and SOUTHCOM had built in the region. Counterterrorism operations increasingly found a prominent position among the command's other objectives.

Characteristics of the AOR

SOUTHCOM's AOR currently covers approximately 15 million square miles and 32 nations. Most areas are characterized by tropical forest and heavy rain, yet there are also deserts and arctic zones. The Andes mountain range dominates much of the landscape and creates fertile valleys that are perfect for the cultivation of coca leaves—more than 90% of the world's coca comes from here. These remote areas also offer ideal locations for the development of cocaine-processing facilities and air strips to move the finished product—more than 60% of the world's cocaine originates here. Multitudes of navigable waters through dense rain forests in the southern portion of the continent also create avenues to move drugs and arms clandestinely.

More than 500 million people populate SOUTHCOM's AOR. The population is a mixture

of Europeans, Hispanics, and native people. Most of the population lives in, or near, poverty in overcrowded cities. Many suffer from low education levels, poor health, and short life expectancies. Wealth is often concentrated in the hands of a few individuals; there is a small middle class, and a wide gap between the rich and the poor. These conditions, along with environmental conditions favorable for drug cultivation, have historically fostered an atmosphere of frequent insurgencies and drug trading as an alternative to poverty. The geographic and political circumstances have created a unique set of difficulties and obstacles for SOUTHCOM to overcome that other combatant commands rarely face.

Major Actions Taken

SOUTHCOM's major actions can be broken down into the following categories: military intervention/combat action, crisis action/advisory support, counterdrug operations, and humanitarian/peacekeeping missions. Antiterrorist operations have most recently been of utmost importance to the command. The role of Joint Task Forces, Guantanamo Bay, Cuba, in the Global War on Terrorism reflects this shifting role. Operation Just Cause, launched in 1989, is one of the most prominent military engagements in which SOUTHCOM has been involved. This operation was in response to the accession to power of Lieutenant Colonel Manuel Noriega following the death of General Omar Torrijos. Noriega stood in the way of constructive U.S./Panamanian relations by violating human rights and disregarding U.S. treaty rights. Eventually, the situation deteriorated enough for U.S. citizens in Panama to be faced with a continuous threat to their lives and livelihood. The conflict ended with the capture of Noriega and the restoration of civilian leaders in May of the same year. After Just Cause, SOUTHCOM reduced its focus on Panama.

The El Salvador civil war of the late 1970s and early 1980s is one of the best examples of SOUTHCOM's role in crisis action and advisory support. In this conflict, SOUTHCOM provided advisory, materiel, and political/military support to the El Salvador government in its battle against communist insurgents. Another example of crisis action came in December 1994 when SOUTHCOM supplied forces to suppress Cuban migrant riots in Safe

Haven camps. These migrants were angered about delays in their application for asylum in the United States.

The first counterdrug operation initiated by SOUTHCOM was Blast Furnace in May 1986. This was followed up by Operations Support Justice I–IV from April 1991 to September 1993. These operations were early examples of regional counterdrug operations conceived by SOUTHCOM's commander. They primarily identified the Peru-Colombia air bridge and documented narcotrafficking response to air interdiction. Counterdrug operations steadily continued after this point. From 1998 to 2002, the United States rapidly increased support for Colombia in the fight against drug trafficking and illegally armed groups. SOUTHCOM spearheaded this effort by providing support to Colombian counterdrug battalions through intelligence, logistics, and training. This strategy was known as Plan Colombia. It attacked drug trafficking directly and through improvement of socioeconomic problems.

SOUTHCOM is continually engaged in humanitarian and peacekeeping missions. Operation Promote Liberty (January 1990 to September 1994) demonstrated a component task force of SOUTHCOM assisting Panama in restoring democracy, security, economic growth, and internal improvements. It was viewed as a success because it culminated in the first uncontested presidential election that the country had seen in 50 years. The most recent and public example of SOUTHCOM's commitment to humanitarian assistance came in January 2010 with Operation Unified Response. This came in response to the catastrophic earthquake in Haiti that claimed the lives of hundreds of thousands of individuals. SOUTHCOM immediately responded and took its place as a leader in the global community seeking to aid the Haitians.

SOUTHCOM and its components regularly undertake humanitarian assistance missions. One of the most successful exercises in recent years has been under the label of New Horizons. These exercises are comprehensive in nature and stress internal improvements of countries, including the construction of schools and medical clinics. Medical readiness training exercises are a large part of these exercises. They utilize teams of doctors, nurses, and dentists to give general health care to host nation citizens. Humanitarian training missions

U.S. Air Force Staff Sergeant Matthew Gruber, a medical element logistics noncommissioned officer in charge, gives a child dewormer after the preventive medicine briefing at a medical readiness and training exercise here on March 9. Members of this team saw more than 370 San Juan villagers on Day 3 of the 4-day medical readiness and training exercise here.

usually last several months, provide infrastructure improvements to host nations, and train deployed U.S. military forces and the host nation personnel. Generally, there are around 60 of these exercises per year.

Reorganization

In September 2007, the secretary of defense authorized the reorganization of SOUTHCOM into a more interagency-oriented organization. In May 2008, the reorganization was implemented. The impetus for this reorganization came from the U.S. Navy admiral James Stavridis, commander of SOUTHCOM from October 2006 to June 2009. Stavridis's command of SOUTHCOM was very innovative—he viewed the region as a “marketplace of ideas” and

felt that the changing nature of the U.S. mission in Latin America and the Caribbean required a more innovative approach to organization. Many of the security challenges that SOUTHCOM faced in its AOR were better addressed by multiple government departments and agencies. Mission lines needed to be crossed and different agencies needed to shift roles. Stavridis believed that this system would improve security challenges and regional understanding.

This reorganization increased the use of “soft power,” yet it did not change the mission of SOUTHCOM dramatically. It still remained a combatant command funded by the Department of Defense. The reorganization primarily altered the structural organization of the command and replaced the Napoleonic J-Code system with an Enterprise Support System. The Enterprise system

The high-speed experimental boat Stiletto sits pierside in Mayport, Florida, June 3, 2009. The 88-foot long, 60-ton vessel was scheduled to deploy on June 13, 2009, under the operational control of U.S. Naval Forces Southern Command and U.S. 4th Fleet under the tactical control of Joint Interagency Task Force—South to conduct counter illicit trafficking operations. Stiletto is manned by a joint army and navy crew and includes an embarked U.S. Coast Guard law enforcement detachment.

Source: Department of Defense photo by Mass Communication Specialist 2nd Class Alan Gragg, U.S. Navy (released).

is more widely used in other government departments, so in theory, it would make interagency cooperation easier. The reorganization was short lived, however. Following the 2010 Haiti earthquake, new commanding general Douglas Fraser, U.S. Air Force, reverted back to the J-Code system because he felt that the massive deployment necessary for disaster relief would go more smoothly under the J-Code organization. Opinions were quite varied in the Department of Defense and interagency community about this decision. Many felt that a combatant command should not move away from traditional military organization, while others saw the reorganization as ushering in a new

era. Regardless, SOUTHCOM continues to be the face of U.S. military relations with other countries in a region vital to U.S. national security and economic prosperity.

U.S. SPECIAL OPERATIONS COMMAND

The U.S. Special Operations Command (USSOCOM) is a unified combatant command with about 60,000 active-duty, National Guard, and reserve personnel from all four services, as well as Department of Defense civilians, with headquarters at MacDill Air Force Base in Tampa, Florida. It is commanded by a four-star officer who may be selected from any service. Like the other eight functional and geographical unified combatant commanders, the commander of USSOCOM reports directly to the secretary of defense.

Approximately two thirds of USSOCOM's personnel are permanently assigned, and the other one third rotate in and out from the four services' special operations commands: U.S. Army Special Operations Command, Naval Special Warfare Command, Air Force Special Operations Command, and Marine Corps Special Operations Command. Some of the best known service components of USSOCOM are the Army Special Forces and Army Rangers, Navy SEALs, Air Force AC-130 Gunship Squadrons and Pararescuemen, and Marine Corps Recon Teams and Scout Snipers.

Special operations forces (SOF) were generally assigned a low priority by conventional forces leaders and the Department of Defense bureaucracy during and immediately after the Cold War. However, following the attacks of 9/11 and subsequent wars in Iraq and Afghanistan, a new emphasis has been

placed on SOF assets and skills. Indeed, President George W. Bush designated USSOCOM as the lead combatant command for planning, synchronizing, and conducting operations against terrorist networks in the Global War on Terrorism.

Command History

As a consequence of two joint operations in the 1980s involving participation by U.S. military SOF, it became apparent that there existed serious problems in command and control and interoperability across the various services in general and among special operations elements in particular. Operation Eagle Claw, the failed 1980 attempt to rescue American hostages from Tehran—and the communications breakdowns among joint force elements during Operation Urgent Fury, the U.S. invasion of Grenada in 1983—together helped spur congressional action resulting in the Goldwater-Nichols Defense Reorganization Act of 1986 and the Nunn-Cohen Amendment to the National Defense Authorization Act of 1987. One consequence was the establishment of USSOCOM and its activation on April 16, 1987, at MacDill Air Force Base. General James J. Lindsay, U.S. Army, was its first commander.

USSOCOM is not dependent on army, navy, air force, or Marine Corps funding for its budget or to develop and buy new specialized equipment, supplies, or services. In a sense, it is a fifth branch of service: the most “purple” service in Department of Defense lingo—the most thoroughly “joint” of the unified combatant commands. Indeed, it operates the Joint Special Operations University at Hurlburt Field, Florida, to serve the professional military education requirements of SOF officers.

Core Mission Capabilities

In addition to its counterterrorism capabilities, USSOCOM is uniquely trained and equipped to accomplish a wide array of both combat and non-combat missions. Among the former are direct action, unconventional warfare, counterinsurgency operations, and counterproliferation of weapons of mass destruction. Noncombat missions include psychological operations, foreign internal defense, civil affairs operations, information operations, special reconnaissance, and security force assistance. Each SOF service component specializes in one or more of

these missions and, thus, contributes to the overall synergy of USSOCOM. For example, the U.S. Army has special psychological operations and civil affairs operations capabilities.

The navy and air force have special reconnaissance and direct action capabilities. USSOCOM assets have global reach, unique flexibility and adaptability, exceptional physical fitness, and the cultural sensitivities and linguistic abilities often lacking in conventional forces.

Recent and Ongoing Operations

Operation Enduring Freedom in Afghanistan and Operation Iraqi Freedom have resulted in sustained, ongoing commitments by USSOCOM. In congressional testimony on March 1, 2011, the then USSOCOM commander, Admiral Eric T. Olson, said that 85% of USSOCOM's deployed troops are working in the U.S. Central Command's area of responsibility, which includes countries in the Middle East, Egypt, and Central Asia. Other Geographic Combatant Commands, including the newest, U.S. Africa Command, have much smaller numbers of "assigned" or "attached" SOF assets. USSOCOM forces have participated in all U.S. military operations abroad since 1987, often clandestinely and behind enemy lines, including Persian Gulf operations Earnest Will (1987–1989) and Desert Shield and Desert Storm (1990–1991). They have been active in counterpiracy operations in Somalia, in the Balkans (Bosnia and Kosovo), and in postearthquake Haiti, where they focused on establishing and manning an air traffic control operation where none existed.

Future Prospects

In an era of asymmetric warfare and unconventional threats it is easy to predict that USSOCOM forces and capabilities will continue to be in high demand. As the U.S. government comes to terms with budgetary realities and the increasingly critical challenge of deficit and debt reduction, American conventional forces are more likely to see reductions than SOF if the current international security environment persists. Indeed, some sources have predicted a modest increase in USSOCOM to about 70,000 members. Even at that number, it would represent just over 3% of the total U.S. active-duty, reserve, and National Guard personnel strength.

SOF are likely to remain "high demand/low density assets" for the foreseeable future.

U.S. STATE DEPARTMENT

America's first cabinet department, established in 1789, was the Department of State. From small beginnings, the State Department has expanded dramatically since World War II. In 1938, the staff of the secretary's office numbered 21; in the 1970s, it exceeded 350. Now, there are some 7,000 officers, mostly employed overseas. In Washington, there are some 15,000 employees. Most are civil service and support personnel. In addition to Americans, the Department of State employs tens of thousands of Foreign Service nationals abroad. Though it ranks as America's smallest cabinet department, it's the most far flung, with personnel in some 200 posts around the world.

The State Department is the lead agency for the conduct of policy and interaction with foreign

nations, save in time of war (in wartime, there is a functional coequal relationship between the military theater commander and the ambassador). Ambassadors are the president's representatives in foreign countries. A practice developed in the 20th century of sending special envoys complicates, and, some argue, diminishes, the traditional role of the ambassador and the embassy.

Diplomacy in its broadest meaning is usually thought of as negotiation, representation, information gathering, and furthering state interests. Classic duties of an embassy include public diplomacy and commercial relations. The U.S. Information Service was reintegrated into the Department of State in 1998. The U.S. Commercial Service was spun off from the State Department in the 1980s and given to the Department of Commerce. At the same time, another foreign service was developed in the Department of the Treasury. The Department of Agriculture, the Federal Bureau of Investigation, the uniformed services, and the Central Intelligence Agency have had distinct services overseas since the 1950s. After the Cold War, the actual overseas duties, missions, and responsibilities of the United States—and by extension of the State Department—have exploded.

Secretary of State

In the early Republic, the position of secretary of state remained influential and served as a stepping-stone to the presidency. Thomas Jefferson, James Monroe, John Quincy Adams, and Martin Van Buren all held the office prior to their election to the presidency. The secretary of state and diplomats conducted much of the diplomacy abroad in an era when the president did not journey outside of the United States and when communication centered on correspondence transmitted by vessels and later by telegraphs.

President Woodrow Wilson broke precedent in his decision to personally lead the American delegation to negotiate the Treaty of Versailles in Paris at the end of World War I. Franklin D. Roosevelt conducted much of his diplomacy during World War II with British prime minister Winston Churchill and Soviet leader Joseph Stalin without Secretary of State Cordell Hull accompanying him in travels that took him to Canada, North Africa, and even the Soviet Union. Distrustful of the State Department,

Roosevelt often appointed special representatives who reported directly to him, such as Harry Hopkins who journeyed on several occasions to Great Britain and the Soviet Union.

The development of jet aircraft and satellite communication has allowed and even encouraged presidents to negotiate more directly with foreign governments and travel abroad. Harry Truman followed Roosevelt's example and personally negotiated at the Potsdam Conference with Churchill and Stalin in 1945. Dwight Eisenhower traveled abroad extensively. Presidents regularly engage in bilateral meetings abroad with foreign leaders and also attend the meetings of a host of multilateral organizations, such as the North Atlantic Treaty Organization.

In spite of greater presidential activism in foreign affairs, the roles of the secretary of state and the State Department in formulating and executing foreign policy increased under a series of influential and controversial secretaries—George Marshall, Dean Acheson, and John Foster Dulles. The creation of the National Security Council and the position of National Security Advisor have institutionally diminished the role of the State Department, however. Under Secretary of State Dean Rusk who served during the administrations of John F. Kennedy and Lyndon Johnson, and William P. Rogers under Richard M. Nixon, the State Department was often marginalized in the decision-making process on key matters of war and peace. Henry Kissinger, as National Security Advisor during Richard Nixon's first term in office, conducted such sensitive diplomatic negotiations as establishing the beginnings of diplomatic relations with the People's Republic of China without the knowledge of the State Department. He played a pivotal role formulating the policy of détente with the Soviet Union and overseeing the negotiations that ended the war in Vietnam. Even when named secretary of state in 1973, Kissinger continued to marginalize the influence of the State Department with regard to foreign policy decision making.

Tensions between the State Department and the National Security Advisor continued under the administrations of Jimmy Carter and Ronald Reagan. Cyrus Vance often clashed with Zbigniew Brzezinski over the direction of U.S. foreign policy with the latter seeking a harder line with the Soviet Union during the Cold War. In 1980, Vance resigned in protest after Carter launched an ill-fated raid to

liberate the American diplomats held hostage by the Iranian government. Not only did Vance oppose a military solution, he also had not been briefed in advance before the operation was to take place and had promised congressional leaders that they would be informed in advance of the use of military force.

Alexander Haig, Reagan's first secretary of state, clashed repeatedly with National Security Advisor Richard Allen and other senior members of the administration over leadership of foreign policy before resigning. His successor, George Schultz, opposed the sale of arms to Iran, but despite these objections, this policy was being carried out secretly by National Security Advisor Admiral John Poindexter and his staff. After the Iran-Contra scandal broke in 1987, Schultz's influence over the direction of American foreign policy increased and Colin Powell replaced Poindexter as National Security Advisor.

James Baker dramatically increased the influence of the secretary of state and State Department under the administration of George H. W. Bush. Baker, a longtime political confidant and advisor to George H. W. Bush before the latter assumed the presidency, played an important role in formulating policies that helped bring about the end of the Cold War. Baker also played a remarkably skillful role in bringing together a diverse international coalition to go to war against Iraq to support the liberation of Kuwait in 1990 that not only included traditional allies such as Canada, Great Britain, France, and Germany but even Syria.

The end of the Cold War and the successful conclusion of the Persian Gulf War led to a growing reluctance by the American public to support an activist foreign policy. Warren Christopher, Bill Clinton's first secretary of state, generally favored a cautious approach in both Yugoslavia and Rwanda, even when it became evident that major human rights abuses, even genocide, were taking place. Madeline Albright, the first woman to hold the office of secretary of state, favored a much more aggressive role in intervening in the former Yugoslavia and asserting American influence abroad. She also was skillful in gaining support within Congress for increased appropriations for the State Department.

Colin Powell served as George W. Bush's first secretary of state; the influence of secretary of state in shaping foreign policy would be diminished,

especially with regard to the approach of the war against Iraq. Vice President Richard Cheney and Secretary of Defense Donald Rumsfeld played dominant roles in building support with the George W. Bush administration and the wider public to go to war with Iraq in 2003. Moreover, Powell and the State Department had only minimal influence in shaping the planning for postwar Iraq. Condoleezza Rice, the former National Security Advisor during George W. Bush's first term, became secretary of state in January 2005 and served until the inauguration of Barack Obama on January 20, 2009.

New York senator and former first lady Hillary Clinton became the third woman to assume the position of secretary of state. Clinton had been a fierce rival for the presidency against Barack Obama in the 2008 election, and before her appointment, there existed skepticism regarding her effectiveness. As secretary of state, Clinton developed a close working relationship with President Obama and traveled extensively abroad to engage in personal diplomacy. In early February 2013, she resigned as secretary of state and returned to private life.

On February 1, 2013, John Kerry, the son of a career Foreign Service officer, became secretary of state. Like Hillary Clinton, Kerry came from the U.S. Senate and also ran unsuccessfully for president (in 2004 as the Democratic nominee against George W. Bush). Representing the Massachusetts in the Senate for 24 years, Kerry gained considerable experience as member and later chair of the Senate Foreign Relations Committee on a range of issues including nuclear arms control and the Middle East Peace process. A Vietnam Veteran, Kerry's political career began as an outspoken opponent of the war after completing his tour of duty as an officer in the U.S. Navy.

Organization of the State Department

In recent years, the State Department has become a mix of geographic (Africa; east Asia, south Asia, and central Asia; Near East; and Western Hemisphere international organizations) and functional bureaus (Administration, Arms Control, Budget and Planning, Consular Affairs, Diplomatic Security, Legislative Affairs, Overseas Building Operations, and Public Affairs), each headed by an assistant secretary of state. The geographic bureaus and country desks are responsible for the daily monitoring

of events around the world. The functional bureaus dealing with congressional relations, intelligence and research, scientific and technological affairs, international organizations, drugs, human rights, politico-military affairs, gender issues, terrorism, and disasters, among others, are responsible for policies that stretch not only across countries and regions but also across other U.S. departments and agencies involved in foreign policy.

American Foreign Service officers (FSOs) are generally recruited through one of America's most arduous and competitive examinations. In recent years, about 20,000 applicants take the exam annually. In the end, only some 200 to 800 people are listed for possible openings in order of rank. There is a 5-year probation for the several hundred who enter each year. After 5 years, more than 90% remain in the service until retirement.

FSOs' work is divided into specialties, with some 1,000 generalists and another 1,000 distinct U.S. Agency for International Development (USAID) FSOs. USAID—the development arm of the State Department—is dramatically undermanned at half the levels of 30 years ago. A 2008 report by the American Academy of Diplomacy and the Stimson Center calculated that USAID required twice the current number of officers to achieve field effectiveness. In contrast to the Cold War era, there were but six engineers at USAID at the end of the G. W. Bush administration and 17 agriculture specialists. Many officers left for higher pay with contractors who worked in development. Development programs in the field were traditionally the responsibility of USAID, but since 2005, the Department of Defense has taken up the slack with Directive 3000, making nation-building a national mission, complete with work in assisting private enterprise, building judicial systems, setting up infrastructure, and promoting public education as an alternative to arms.

The State Department also undertakes wider missions, including disaster relief and protecting individuals who have been the victim of mass violence or genocide. The cost of the State Department's overseas aid, disaster relief, public diplomacy, and overseas work in general is less than 5% of what is spent on defense, some \$50 billion in all. The reduction in State Department funding has had negative ramifications for many of its officers. As America withdrew from Iraq and Afghanistan, for instance,

several dozen intensive provincial reconstruction teams were left underfunded, undermanned, and unprotected.

Another lingering problem with overseas work is the inadequate language competence of many Americans overseas, including that of both diplomatic and, increasingly, military officers in diplomatic roles. Foreign Service posts in so-called hard-language areas are often understaffed. All officers 5 years into service have had some language training. Fewer know the languages that take years to master and that are in the most demand. The Government Accountability Office recently found that more than 60% of positions in hard-language areas were filled by people who could not function without an interpreter.

Ideally, the State Department's institutional position ensures that the foreign policy establishment is operating within some consistent policy framework. However, the State Department's contemporary ineffective policy coordination results from a mismatch between the State Department's size and that of the foreign affairs bureaucracy to be coordinated. Moreover, its first function, of diplomacy—the negotiation and resolution of disputes by means of treaties and other agreements—has fallen from consistent use and repute. In the Cold War and the Global War on Terrorism, an emphasis has been placed on the use or threat of force rather than on negotiation. This has served to marginalize the State Department's role.

Personnel Problems at State

During the earliest decades of the Cold War, the Department of State underwent rapid expansion that left it internally incoherent and demoralized and, ironically, overstaffed. There were too many people pursuing too little substantive work in a bureaucracy that demanded advancement or obliged retirement. Many in the State Department tried to resist that growth. In 1958, the Ambassador to Brazil, Ellis Briggs, learning that he was about to be the recipient of a new science attaché, cabled the State Department, "The American embassy in Rio de Janeiro needs a science attaché the way a cigar store Indian needs a brassiere." Briggs's response was to no avail; within 10 years, the embassy had two science attachés.

In the early 1950s, the State Department was plagued by two personnel systems: first, an elite

group of FSOs stationed abroad who represented presidential policy and, second, a number of state-employed civil service employees responsible for administration, economic aid, and some intelligence work. When these two systems were merged, many employees found themselves unprepared and ill equipped to perform their new duties. Career diplomats—"generalists" by training and disposition—were shifted to technical jobs for which they were frequently ill prepared. FSOs lost overseas allowances and the opportunity to prove that they had political skills that still constituted the essential criteria of promotion. The purpose of the merger, it was said, was to ensure that American FSOs did not "go native," an endemic worry for many in Congress and the press.

In the heyday of Senator Joseph McCarthy's search for communists at the State Department, fear shattered Foreign Service morale. Many Asian experts were mustered out in the search for traitors. Even the military architect of America's victory in World War II, George Marshall, a model public servant who was also called from retirement to be secretary of state where he led the charge to rescuing Europe with a program that bears his name, was labeled a traitor by vocal elements of the Republican right. Dwight Eisenhower had been Marshall's military aide and speechwriter, but Eisenhower never defended his mentor and friend.

In the 1960s, the ghost of McCarthy walked the halls of Foggy Bottom. The mantra for officers entering the halls was "There are old officers and there are bold officers, but there are no old, bold officers." Fear and caution, endemic to most bureaucracies, was palpable, especially in older officers. Since the job of a veteran FSO has almost no civilian counterpart, officers in their middle or late 40s knew that they were at a real disadvantage when they contemplated any outside job. Skills in bureaucratic survival and the diminishing grasp of perhaps a half dozen foreign languages did not seem to be fungible assets in the private sector. Pensions and salary after 20 years in the Foreign Service were less than what a contemporary military officer might make.

The 1980 Foreign Service Act revised promotion and retention standards based on "performance." But there were still not enough jobs. Each FSO, according to the 1980 reform, had 20 years

to ascend the ladder to the highest rungs. If he or she did not, he or she was "retired." For the 1970s and 1980s, for all intents and purposes, diplomacy had become a 20-year career. The results affected the esprit de corps of older officers who considered themselves, with some justification, part of "a last great aristocracy." Promotions jammed up. Since the Foreign Service emphasized promotion or resignation after a few years in each grade, the pressure for good jobs (and good reports from one's superiors) became excruciating. The situation was made worse by the expansion of political appointees as ambassadors in the later part of the 1960s, and even more damagingly in the 1980s. Perversely, recruitment actually accelerated in the mid-1960s, and again in the mid-1980s. Thus, there were even more people chasing fewer good jobs.

This glut of FSOs lasted until the end of the Cold War. The situation did not come into balance until the end of the Soviet era when some 20 new nations appeared just when the State Department had fewer resources and manpower to cover them. For most of the 1990s, missions expanded but resources all but collapsed. After September 2001, personnel shortages became critical. Two wars soaked up more than 1,000 FSOs, some in continuous rotation through war zones for long stints without families. The Foreign Service, for the first time in two generations or more, was desperately undermanned.

Post-Cold War fiscal constraints during the 1990s reversed the chronic issue of overqualified and underemployed officers. Funding fell for nearly a decade. "Core" diplomats were given responsibilities ranging from epidemics to the detritus of dealing with the consequences of the Soviet collapse. Twenty new embassies were opened, principally in the states of the former Soviet Union and Yugoslavia, and staffs were slimmed or, in the case of Western Europe, closed. Overall, staff levels have remained remarkably consistent since the end of the Cold War, with a slight bump during the prosecution of two wars and the Global War on Terrorism.

An Uncertain Future

In the 21st century, with jobs more abundant, one would think that the "crisis at State"—a 35-year-old phenomenon—had abated. But fiscal austerity, the lack of a domestic constituency, and a succession

of hostile Congresses left the State Department very much orphaned. Secretary of Defense Robert Gates became an ally of Secretary of State Hillary Clinton. Together, Gates and Clinton embraced the cause of civilian soft power programs, and even Chairman of the Joint Chiefs, Admiral Mike Mullen, joined in a call to transfer monies from the Department of Defense to the long-suffering State Department. In early 2013, a new team headed the State and Defense Departments, respectively, with John Kerry at Foggy Bottom and former Republican Senator Chuck Hagel of Nebraska at the Pentagon. Although from different sides of the political aisle, both men served in Vietnam and remained cautious about deploying American forces abroad.

U.S. STRATEGIC COMMAND

U.S. Strategic Command (STRATCOM) is the Unified Combatant Command responsible for strategic nuclear, space, cyber, and intelligence surveillance and reconnaissance planning and missions. STRATCOM was established in 1992 by order of President George H. W. Bush and is commanded by General Robert Kehler from its headquarters near Omaha, Nebraska.

STRATCOM traces its origins to the Second World War and the U.S. Army Air Forces. As effective strategic bombardment platforms emerged during the war, the long-range, large-scale attack of enemies by air became a possibility. Fleets of strategic bombers could deliver large amounts of

conventional weapons, inflicting severe damage, as seen in the 1945 American firebombing campaign of Japan's urban centers. During the same period, the development of atomic weapons resulted in greater implications for the use of strategic bombing. Recognizing this new capability, the Army Air Forces established Strategic Air Command (SAC) in 1946. Defense planners envisioned that the new command would accrete strategic air power assets within one body, simplifying the unity of command and building an organizational structure that would be able to craft and execute strategic nuclear and conventional war plans.

SAC Leaders and the Development of a Reliable Plan for Nuclear War

SAC's first commander was General George Kenney, a veteran of two World Wars. Kenney remained in command following the establishment of the U.S. Air Force in September 1947. Kenney was criticized for a lackadaisical approach to leadership of the command and the atrophy of any significant ability to conduct nuclear or mass conventional bombing operations and was replaced in the fall of 1948 by Lieutenant General Curtis E. LeMay, who the American public knew best as the man responsible for the firebombing of Japan during the Second World War.

Under LeMay, the command grew in size and ability. Through LeMay's leadership, the command developed or implemented many of the concepts and practices that would come to define Cold War nuclear operations, aspects of which survive to the present day. Most notably, LeMay insisted on a constant state of readiness for SAC's nuclear forces and personnel and fostered a palpable sense of urgency among his subordinates that bordered on paranoia. More tangibly, during LeMay's tenure as commander the transfer of nuclear weapons from the Atomic Energy Commission to SAC bases took place in 1954. LeMay advocated for and ensured new jet bombers like the B-47, and the still-serving B-52 bomber and KC-135 aerial tanker were introduced into the fleet. At the same time, LeMay developed a rigid program of command and control of nuclear operations, supported by extensive planning for countless scenarios under which nuclear war might occur.

Despite the rigorous efforts of LeMay and his successor, General Thomas S. Power, to prepare SAC to execute a nuclear war in myriad scenarios, confusion remained. SAC was only responsible for war planning within the command itself. The leaders of other commands and the staffs of the other armed services independently developed and prepared to execute their own war plans. By 1960, this lack of cooperation among the services and warfighting commands was apparent. Fratricide and duplicitous effort, as a result of multiple nuclear weapons being independently delivered unknowingly to the same target by separate services, topped the list of concerns. The Joint Strategic Target Planning Staff (JSTPS) was created to address these uncertainties.

JSTPS, SIOP, and SAC as a Specified Command

Established in 1960, JSTPS was designed to synchronize the forces of the armed services in a nuclear war. The JSTPS was housed in the SAC headquarters but reported to the Joint Chiefs of Staff. The staff included military representatives of the army, navy, Marine Corps, and air force, with a number of the air force personnel simultaneously serving as SAC staff.

JSTPS was responsible for producing the Single Integrated Operations Plan (SIOP), which was designed to prevent interservice fratricide and mission duplication during a nuclear war. The first SIOP was drafted in 1960, but covered Fiscal Year 1962, and was known as SIOP-62. A new SIOP was drafted for each fiscal year and described the essential details of each strike, as well as individual service responsibilities in the event of a nuclear war. The annual SIOP served as the cornerstone of Cold War planning for a nuclear exchange. Whereas SAC had created a reliable means by which to conduct a nuclear war, JSTPS and SIOP formed the nucleus of the national enterprise for carrying out such a war.

While JSTPS provided nuclear war plans, it was not a warfighting command, and it would not execute the plans it built. In addition to being a U.S. Air Force Major Command, from 1955 onward SAC was designated a Specified Command, serving as both a Combatant Command and an air force organization. SAC was given the responsibility for the command and control of a nuclear war. As such,

SAC would oversee the execution of a JSTPS-crafted war plan and coordinate the American strategic nuclear offensive for all the armed services in the event of a nuclear war. This arrangement would remain intact through the end of the Cold War in the early 1990s. With the conclusion of that conflict, however, there would be changes. During the post-Cold War reorganization of the U.S. military, STRATCOM was created to fully vest strategic nuclear planning, command, control, and execution in a true joint command.

The Birth of STRATCOM and Its Mission: 1992–2002

By the early 1990s, the Soviet Union was clearly in decline. As the Soviet Union quickly lost its ability to control satellite states in Europe and the Soviet government's ability to pay for expensive military programs abated, diplomatic and military tensions between the two superpowers eased. Given these dramatic changes and the internal interest of the United States in ending the military tensions and fiscal costs of the Cold War, George H. W. Bush directed the establishment of STRATCOM, effective June 1, 1992. This event would coincide with the simultaneous disestablishment of SAC. A provisional STRATCOM staff was established in 1991 to begin building the new command and to ensure the transfer of mission responsibility to the new Unified Command without loss of capability.

From its inception, STRATCOM's mission has been to oversee the planning and, if necessary, execution of a nuclear war. With the drawdown in military forces in the 1990s, particularly nuclear-related forces, STRATCOM assumed the majority of the command and control responsibilities previously held by SAC. In essence, STRATCOM became a singular embodiment of the separate mission of SAC and JSTPS.

Contemporary Mission, Organization, and Operations: 2002 to the Present

From its 1992 establishment until 2002, STRATCOM was almost exclusively a nuclear command, but with the 2002 disestablishment of U.S. Space Command and the assumption of that command's duties, STRATCOM diversified its mission set and roles. In addition to its traditional roles, space operations became an area of focus,

as well as the mitigation of threats posed by the rogue use of weapons of mass destruction, ballistic missile defense, strategic intelligence, surveillance, reconnaissance, and, eventually, cyber operations. Although initially envisioned as a predominantly nuclear command, STRATCOM has become the manager for the missions and functions that are not readily contained to a particular geographic region. STRATCOM is organized to support these missions.

Organized as a “Joint Staff” (see Table 1), the headquarters staff comprises members of each of the armed services, Department of Defense civilians,

select members of other government agencies, and contractors. Directorates are organized according to function.

At STRATCOM’s headquarters, military and civilian personnel work in the underground Global Operations Center, monitoring the global battle space, ready to command and control American forces engaged in a nuclear conflict. During the Cold War, the Global Operations Center housed what was often referred to as the “War Room,” the core of SAC operations. The Global Operations Center continues to provide a secure, hardened facility where the STRATCOM commander and staff can execute national policy despite the chaos of a nuclear exchange.

Each of the armed services has established a component command that provides apportioned forces to STRATCOM. The largest share of forces comes from the air force and navy, which share responsibility for the three major components of the U.S. nuclear arsenal, also known as the nuclear “triad” (see Table 2).

The army and Marine Corps also contribute forces to STRATCOM’s mission, though on a smaller scale, as neither service has nuclear weapons. U.S. Army Forces Strategic Command and Marine Corps Forces U.S. Strategic Command are responsible for support to STRATCOM’s mission. Most notably, the U.S. Army Forces Strategic Command provides the fielded forces responsible for interception of ballistic missiles threatening the United States. Given the recent emphasis on the

Responsibilities	First two legs of the nuclear triad • Strategic nuclear bombers • Intercontinental ballistic missiles	Worldwide aerial refueling Transporting of material Provides tankers to support Air Force Global Strike Command’s bombers on an as-needed basis	Third leg of America’s nuclear triad • Submarines armed with nuclear-capable submarine-launched ballistic missiles

cyber mission, both the army and marine component commands, which contribute to this mission, are likely to see an increased role in STRATCOM operations.

A Sub-Unified Command was created in 2010 for cyber operations and is known as the U.S. Cyber Command (CYBERCOM). Though attached to STRATCOM, CYBERCOM is commanded by a four-star general or admiral and is, in many ways, an independent actor. In recognition of its critical mission, there are increasing calls for CYBERCOM to be detached and made a Unified Command equivalent to STRATCOM. For now, national responsibility for cyber operations remains under the ultimate purview of STRATCOM.

Following its 2002 reorganization, command and control of the various functional areas overseen by STRATCOM were broken into more narrowly focused operational organizations. The new subcommands were given the title of Joint Force Component Commands (JFCC) and assumed joint-level responsibility for the coordination of the individual armed service components' contributions to a particular mission.

Four JFCCs were created:

1. *JFCC-Global Strike: Responsible for strategic deterrence and global strike planning and execution*
2. *JFCC-Space: Plans, coordinates, and executes U.S. space operations*
3. *JFCC-Integrated Missile Defense: Oversees the national ballistic missile defense mission, including the planning and coordination of a response to an attack*
4. *JFCC-Intelligence, Surveillance, and Reconnaissance: Serves as the coordinating body and clearinghouse for strategic intelligence, surveillance, and reconnaissance issues*

Task Forces are created on an as-needed basis for specific missions or functions. Current task forces include the ones dedicated to airborne command and control, aerial refueling, intercontinental ballistic missiles, submarine-launched ballistic missiles, and bombers and reconnaissance. From 2004 to 2010, there was a task force dedicated to the cyber mission, which was eliminated with the establishment of CYBERCOM. In the event of war, it would be the

task forces that would carry out STRATCOM's plans. The task force construct provides STRATCOM flexibility in building and employing forces.

In addition to the JFCCs, two centers were also created. The first of these is the U.S. Strategic Command Center for Combating Weapons of Mass Destruction, located in northern Virginia at Fort Belvoir. The intent of this center is to provide a knowledge base and expertise that can be leveraged to prevent the international spread of weapons of mass destruction. The second center is the Joint Warfare Analysis Center, also located in Virginia, at Naval Support Facility, Dahlgren. The Joint Warfare Analysis Center provides STRATCOM, as well as other commands, with technical and scientific expertise that can be applied to problems facing commanders and their organizations.

Commanders

The commander of STRATCOM can come from any of the armed services and, like the Department of Defense's other Unified Commands, holds the rank of four-star general or admiral. STRATCOM's first commander was air force general George Butler, who relinquished command to the organization's first navy leader, Admiral Henry Chiles, in 1994. On Chiles's departure in 1996, one of STRATCOM's most notable commanders was appointed, air force general Eugene Habiger. Though Habiger was assigned to SAC for much of his air force career, Habiger became known and respected for his emphasis on deescalating nuclear tensions and is seen as one of STRATCOM's most successful commanders.

In the post-9/11 era, two unique individuals served as commanders of STRATCOM: marine general James Cartwright, the only Marine to serve as the commander of STRATCOM, and air force general Kevin Chilton. Both leaders' appointments were questioned by some as neither officer had significant experience in nuclear operations. Ultimately, both were considered excellent choices and their periods in command were overall successes. In part, these officers were selected to signal a shift in command priorities from the nuclear-centric mind-set that had dominated the command to one that more broadly considered the concept of global strategic operations and the growing variety of missions that are under STRATCOM's purview. In the wake of a

recent series of air force nuclear errors, which took place outside of STRATCOM's responsibility, policymakers demanded a greater emphasis on nuclear readiness within the Department of Defense. As a result, it is likely that, in the immediate future, subsequent STRATCOM commanders will be drawn from the ranks of nuclear-experienced officers.

STRATCOM's current commander, air force general Robert Kehler, previously served as the deputy commander of the organization. Kehler's selection marked a return to the practice of selecting a commander with significant background and experience in nuclear operations. Kehler spent much of his air force career in intercontinental ballistic missile operations, but he is unique as the first air force officer to command STRATCOM who was not a pilot.

Notable Operations

Unlike the other Unified Commands, STRATCOM does not regularly engage in shorter duration, high-intensity operations. Instead, STRATCOM is primarily concerned with long-term monitoring or readiness missions. From 1992 to the present, STRATCOM has successfully carried out the task of global nuclear deterrence. Though not considered a singular operation in the traditional sense, the 20 years of successful nuclear deterrence provided by the men and women of the command has been a silent hallmark of the post-Cold War period. Additionally, despite continuing policy and military interest in de-emphasizing nuclear warfare, STRATCOM has increased American capability in that realm.

Similar to the nuclear deterrence mission, the 2002 assumption of U.S. Space Command's operational responsibilities, which included cyber security, means that STRATCOM has been responsible for monitoring and protecting American cyber resources. This mission was first executed through Task Force-Computer Network Operations and eventually became part of CYBERCOM. This mission continues as CYBERCOM's core focus. The specifics of these operations are not public due to security and classification issues.

One significant operation stands out: Operation Burnt Frost. In 2008, STRATCOM completed a well-publicized mission when President George W. Bush made the decision to shoot down an errant satellite that was in an uncontrolled orbit around

earth. Responsibility for this mission was given to planners at STRATCOM. Drawing on forces from at least three of the armed services (army, navy, and air force), STRATCOM successfully executed the operation. STRATCOM's success in orchestrating this operation was an indication of the growth and maturity the command had experienced since its assumption of duties, besides the field of nuclear deterrence and operations, beginning in 2002.

The Future

Though the Cold War ended more than 20 years ago, STRATCOM's primary mission of nuclear deterrence and operations will remain an area of national emphasis for the foreseeable future. In the coming decades, it is likely that this mission will be ramped down, in accordance with international treaties designed to reduce or eliminate nuclear weapons arsenals. At the same time, it is likely that STRATCOM will increasingly focus on long-range, conventional strategic strikes and cyber security. As long as missions exist that cross the geographic boundaries of the other Unified Commands and are of critical importance to the security and survival of the United States, there will be a need for STRATCOM.

U.S. SUPREME COURT

Article III of the U.S. Constitution establishes the Supreme Court of the United States but says little else about it. The Constitution also gives Congress the right to declare war and gives the president the title of commander in chief. Over the years, the Court has been hesitant to intervene in military matters, preferring to leave them to the other branches. Nevertheless, it has rendered some important decisions in this area, which will be highlighted in this entry.

Early Decisions

During the tenure of Chief Justice John Marshall, the Court rendered many historic decisions. One of its less-noticed ones was nonetheless of importance to the military. In *Martin v. Mott* (1827), it looked at a clause in Article I, Section 8, of the Constitution giving Congress the power to call forth a state militia and place it under federal officers. Congress had delegated that power to the president, and the Court upheld that delegation because events occur while Congress is not in session.

The aftermath of the Civil War produced several decisions involving the military. In *Ex Parte Milligan* (1866), the Court overturned a conviction and death sentence given to a civilian by a military

tribunal authorized by the president because the civil courts were still functioning in that area. In *Georgia v. Stanton* (1868), the Court refused to issue an injunction to prohibit the secretary of war and two generals from enforcing the Reconstruction Acts. It held that the matter was a political question to be decided by the political branches of the government. Similarly, in *Ex Parte McCardle* (1868), the Court upheld Congress taking away its jurisdiction to hear an appeal from someone who had been tried and convicted by a military commission, as it said that Congress has control over the cases the Court may hear on appeal.

World Wars

World War I, on the other hand, saw only one decision involving the military, but it was an important one because the issue was about the constitutionality of conscription (the draft). There was a draft during the Civil War, but the Supreme Court heard no case concerning it. In 1917, Congress passed the Selective Draft Act, and there were a series of cases challenging it. The Court decided them jointly in the 1918 *Selective Draft Law Cases* and, to nobody's surprise, upheld it unanimously because of the power given to Congress in the Constitution to raise and support armies. As the Court said, "What good was it to be given a power and then have no way to enforce it?" Among the more interesting claims by opponents challenging the law were that it was involuntary servitude, thus violating the 13th Amendment, and it violated the First Amendment prohibition on governmental establishment of religion due to its exemption of ministers and theology students.

World War II, on the other hand, had several decisions involving the military. In the 1942 *Ex Parte Quirin* case, the issue was how President Franklin D. Roosevelt opted to try eight Nazi saboteurs captured after landing by submarine in the United States. They had on them devices to blow up buildings, bridges, and railroad centers, all of which were on lists they carried. Roosevelt ordered that they be tried by a military tribunal, and they were convicted of four charges involving violations of the law of war. Six were sentenced to death and two to imprisonment. A unanimous Court upheld the president's power to create military tribunals for offenses such as these due to various laws

passed by Congress under the war powers in the Constitution.

Next came the famous cases involving the 112,000 Japanese in the United States, of whom some 70,000 were American citizens. Roosevelt issued an executive order allowing military generals in charge of military areas to do what they deemed best to keep those areas secure. Congress later passed a law saying the same thing and providing penalties for those who disobeyed. The general in charge of the west coast at first decided to impose a curfew from 8 p.m. to 6 a.m. for all persons of Japanese ancestry as well as for German and Italian nationals. The Court in 1943, in *Hirabayashi v. United States*, unanimously upheld the curfew under the war powers for the president and Congress in the Constitution to prevent espionage and sabotage, saying that the military had to be able to use its discretion in executing those powers. Similarly, in the 1944 case of *Korematsu v. United States*, a 6–3 decision upheld a general’s order that all persons of Japanese ancestry living on the west coast be sent to internment camps. Once again, the reasoning was based on presidential and congressional war powers, with the military having discretion in deciding what was best for security purposes. The dissenters, on the other hand, thought the exclusion was based on race, not military necessity. The final case was the 1944 *Ex Parte Endo*, in which a unanimous Court ruled that once a person’s loyalty had been proven, that person could not be kept in an internment camp. Otherwise, race rather than military necessity would be an unconstitutional reason.

The last two cases stemming from World War II occurred in 1946. *In re Yamashita* was about whether a Japanese general, sentenced to death by a military tribunal because of the atrocities committed by his troops in the Philippines, should have been tried instead by civil authorities. The Court upheld his conviction in a 7–2 decision, saying that the Constitution did not apply to him as far as rights or civil courts were concerned. All that he was entitled to was to have his conviction appealed to a higher military body. *Duncan v. Kahanamoku* (1946) looked at the issue of the setting up of a military government to rule the Hawaiian Islands the day after the Japanese attacked Pearl Harbor. From that time until March 1943, the military ran everything, including trials. At that point, civil matters, but not criminal ones, were turned over to civil authorities.

Criminal matters stayed with the military until October 1944. The Court ruled that the entire length of the military rule was illegal. Congress, in setting up the government of Hawaii in the 1900 Organic Act, allowed for military rule only in cases of actual invasion or rebellion. Since neither had occurred there, the law was violated.

From the 1950s Through the 1990s

In the 1955 case, *United States ex rel. Toth v. Quarles*, the Court looked at the military justice area, in this case a section of Congress’s 1950 Uniform Code of Military Justice, which allowed a person who had been discharged to be subsequently court-martialed for something done while in service. The Court ruled the section unconstitutional as it was conflicting with Article III of the Constitution, which set up the federal courts with procedural safeguards not found in military tribunals. It was unimpressed with the arguments that the president as commander in chief and Congress in making rules for the armed forces could authorize anything such as this. Similarly, in the 1958 case of *Trop v. Dulles*, the Court struck down a law that allowed the taking away of citizenship for desertion from the armed forces, reasoning that since the 14th Amendment confers citizenship on those born in the United States or in its territories, the government cannot take away that citizenship. Also, even if it did have that right, it could not be upheld in this instance because it did not derive from Congress the power to wage war. A closely related case was *Kennedy v. Mendoza-Martinez* in 1963, where a 7–2 decision struck down sections of the 1940 and 1952 Nationality Acts that had allowed the government to take away citizenship without a trial of those who stayed out of the country in time of war to evade the draft. The rationale was that the acts were penal in nature and thus require the procedural safeguards found in the Fifth and Sixth Amendments. These safeguards would include rights such as a grand jury, a petit jury, and the right to counsel. The dissenters argued that the sections were a valid exercise of Congress’s war powers.

In the 1965 case, *United States v. Seeger*, the Court clarified the definition of being a conscientious objector and therefore exempt from the draft. In the draft laws of 1917, 1940, and 1948, Congress made provisions for conscientious objectors, in the

last law basing it on a person's religious training and belief, which was defined as "an individual's belief in a relation to a Supreme Being." The Court held that this belief did not just mean a belief in God in the traditional meaning but also meant "sincere and meaningful belief which occupies in the life of its possessor a place parallel to that filled by the God of those admittedly qualifying for the exemption." The Court, however, would not tolerate people burning their draft cards in public to show opposition to the war in Vietnam. In the 1968 case of *United States v. O'Brien*, an 8–1 decision upheld a 1965 law that made it a crime to knowingly destroy a draft card. It came under Congress's power to raise and support armies, and Congress had the right to see that its method of doing so—that is, the draft—would not be defeated by having the draft cards destroyed. It was an important decision in favor of the government and the Selective Service system.

In *Gutknecht v. United States* (1970), the Court ruled against the head of the Selective Service System who, 3 years earlier, had recommended that draft boards around the country immediately put into the military those who had illegally demonstrated against the draft, even if it meant reclassifying them. Some 500 students found themselves in the army in 1968 due to the cancellation of their deferments, but the Court ruled that the law did not authorize the Selective Service System to use immediate induction as a disciplinary or vindictive measure. Then, in the 1971 case *Gillette v. United States*, the Court heard another case involving conscientious objectors, this time concerning those who did not oppose war in general but did object to the Vietnam War. The Court held that under the law, conscientious objector status could only be given to those who oppose all wars, saying that the government had to have a fair draft system, one that was administratively workable, and the system set up for conscientious objector status was neutral and secular.

With the influx of women into the military, the Court decided two cases dealing with their status. In an 8–1 decision in the 1973 case *Frontiero v. Richardson*, the Court said that the military had to treat married women the same way as married men with regard to fringe benefits. In this case, a man in the military automatically received housing and health benefits for his civilian wife, but a woman in the military, to receive the same benefits for her

civilian husband, had to show that he was dependent on her for at least half the family's income. In the 1975 case *Schlesinger v. Ballard*, the Court upheld a regulation that allowed a woman who was passed over twice for promotion in the navy to stay in service for 13 years, whereas a man passed over twice for promotion could stay only for 9 years. The Court's rationale was that there was greater opportunity for promotion for men than for women.

Selective Service v. Minnesota Public Interest Research Group in 1984 was another case concerning the draft. The Court upheld a 1983 federal law that withheld financial aid from college students who did not register for the draft. The Court said that nobody was being punished. Any student eligible for financial aid could obtain it by registering. None of the students involved in the suit had tried to register. This was followed in 1985 by *Wayte v. United States*, in which the Court upheld the government's decision to prosecute those who publicly announced that they were not registered for the draft or that they were not going to register, as well as nonregistrants whose names were reported to the government. In this case, the one that involved 13 of the vocal nonregistrants, the rationale was once again the government's interest in raising and supporting an army.

The 1986 case of *Goldman v. Weinberger* involved the First Amendment rights of Goldman, who was a commissioned officer in the U.S. Air Force, an Orthodox Jew, and an ordained rabbi. In a 5–4 ruling, the Court upheld an air force regulation stating that only armed security police could wear headgear indoors. The Court found that the air force's strong interest in discipline justified the strict enforcement of its uniform dress requirements, and thus, it was constitutional to prohibit Goldman from wearing a yarmulke while on duty. Uniforms encourage unity, and therefore, the regulation was a reasonable one. The dissenters on the Court argued that one of the functions of the First Amendment is to protect the rights of religious minorities and that the air force did not show that the costs involved in accommodating Goldman's request would be significant. The military must abide by the Bill of Rights just as civilians must.

The 1990 case of *Perpich v. Department of Defense* was a unique one involving control over the National Guard. In 1952, Congress said that

in order for the federal government to activate the National Guard, it must get the consent of the state's governor. However, in 1986, Congress partially repealed that requirement, stating that a governor could not withhold consent because of any objection to the location, purpose, type, or schedule of such duty. The governor of Minnesota objected to his troops being sent on a 1987 training mission to Central America, but a unanimous Court upheld the federal government. Its rationale was that the Constitution allows Congress to order the National Guard to active federal duty for the purpose of training outside the United States without the consent of the governor or the declaration of a national emergency. The Guard loses its state status when called to active duty. Therefore, since the original governor's veto was not constitutionally compelled, its partial repeal was valid.

In the 1998 *United States v. Scheffer* case, the issue was the admission of a polygraph test to prove innocence. An airman had used the polygraph test to show that he had not used drugs, but the test results were inadmissible as the Military Rules of Evidence do not allow polygraph evidence in court-martial proceedings. In an 8–1 decision, the Court agreed that the polygraph results should be inadmissible, given that as a defense is possible without it, defendants can still testify in their own behalf, and there is no consensus that polygraph evidence is reliable.

The 21st Century and the Global War on Terrorism

The terrorist attacks of September 11, 2001, resulted in the United States declaring a Global War on Terrorism, and in the process of fighting in places such as Iraq and Afghanistan, the country captured hundreds of people it designated as enemy combatants. It decided to house them at Guantanamo Bay, an area in Cuba under the control of the United States. The legal issue that subsequently arose was whether these detainees could challenge their detention in habeas corpus motions to federal courts. In 2004, the Court, in a 6–3 decision in the case of *Rasul v. Bush*, held that federal judges do have jurisdiction to consider the detainees' petitions. The basis for the decision was that Guantanamo Bay was a territory in which the United States exercises exclusive

jurisdiction and control under its 1903 lease. The dissenters felt that the scope of the habeas corpus writ was being extended too broadly.

Another decision dealing with habeas corpus came in 2004 in the case of *Hamdi v. Rumsfeld*, which concerned the 2-year-long detention of an American citizen who was designated an enemy combatant. Although all the justices but one held the detention invalid, they were fragmented as to their reasoning. Justice Sandra Day O'Connor, in an opinion joined by Chief Justice William Rehnquist and Justices Stephen Breyer and Anthony Kennedy, wrote that the detention was permissible if the designation as an enemy combatant proved correct, but that Hamdi's inability to appear before a judge, challenge the government's evidence, and tell his side of the story deprived him of his constitutional right to due process. The plurality opinion said that there was statutory authority for Hamdi's detention, however, under the Authorization for Use of Military Force passed after 9/11, which authorized "all necessary and appropriate force" to pursue and prevent international terrorism. Justice David Souter, joined by Justice Ruth Bader Ginsburg, agreed with the plurality opinion that Hamdi should have had due process protections to challenge his status but argued that the detention had no legal basis as a matter of statutory authority. Justice Antonin Scalia, in a dissenting opinion joined by Justice John Paul Stevens, said that the detainee was entitled to a habeas corpus writ unless the government prosecuted him for treason or Congress exercised its constitutional authority to suspend habeas corpus. In a separate dissent, Justice Clarence Thomas argued that the detention was constitutional under the federal government's war powers.

In 2006, the Court, in the case of *Rumsfeld v. Forum for Academic and Institutional Rights*, unanimously upheld a 2004 federal law known as the Solomon Amendment requiring access to universities for military recruiters at least equal in quality and scope to that of other employers. Schools that do not comply risk forfeiting grants to the entire university from eight federal agencies. The case was brought by a coalition of law schools. The Court ruled that the law did not violate the free speech rights of universities that objected to the military's exclusion of homosexuals who are open about their sexual orientation under the "Don't Ask, Don't Tell" policy then

in effect. The law affects what law schools must do, not what they may or may not say. It neither limits what law schools may say nor requires them to say anything. In addition, the Court noted that allowing military recruiters on campus was not an inherently expressive activity (hosting interviews and receptions for recruiters is not speech); it did not interfere with the law schools' freedom of association (recruiters come to try to hire students, not to become members of the school's expressive association); a school may not get around the law by excluding all employers who do not commit to a nondiscrimination policy (an approach that would render the law largely meaningless); and Congress, under its power to raise and support armies, could have directly required the recruiters to be admitted instead of taking the more indirect approach of making access a condition of federal financing.

In the 2006 case of *Hamdan v. Rumsfeld*, the Court in a 5–3 decision ruled against the George W. Bush administration's attempt to put Guantanamo detainees on trial before military commissions, with the majority saying that these efforts were unauthorized by federal statute and violated international law. Although acknowledging that historically these commissions were established out of necessity arising from wartime conditions, the Court ruled that these conditions did not justify the abolishment of procedural protections. Common Article 3 of the Geneva Conventions applies to these detainees and is enforceable in federal court for their protection. The rules the Bush administration issued for the commissions failed to guarantee the defendant the right to attend the trial and allowed the prosecution to introduce hearsay evidence, unsworn testimony, and evidence obtained through coercion. Hamdan had been charged with conspiracy, and the Court said that conspiracy was not a violation of the law of war and, thus, could not be the basis for a trial before a military panel. The case against Hamdan started before the 2005 Detainee Treatment Act, which provided that no court, justice, or judge has jurisdiction to hear habeas corpus petitions filed by the detainees; thus, it did not apply to pending cases, including *Hamdan*. Justices Scalia, Alito, and Thomas argued in separate dissents that the Court lacked jurisdiction in this case.

In 2008, the Court decided two more cases involving the military. In *Munaf v. Geren* (2008), it unanimously held that two civilian U.S. citizens

being held in American military custody in Iraq were entitled to file habeas corpus petitions. The administration had argued that the two were technically held by the 26-nation multinational force there and thus federal courts did not have jurisdiction, but the Court ruled that what mattered was that they were held by American soldiers subject to a U.S. military chain of command. However, though it allowed the petitions, the Court denied them because the men were facing criminal charges under Iraq law, and their release would interfere with Iraq's sovereign authority to punish offenses against its laws committed within its borders.

In the other case, *Boumediene v. Bush* (2008), the Court in a 5–4 decision held that the detainees at Guantanamo Bay have a constitutional right to go to federal court under a habeas corpus petition to challenge their continued detention as enemy combatants. Thus, the Court found unconstitutional a provision of the 2006 Military Commissions Act that stripped the federal courts of jurisdiction to hear these petitions because the Constitution allows the writ to be suspended only in times of invasion and insurrection. The Court also said the Detainee Treatment Act's review procedure for the detainees fell short of being a constitutionally adequate substitute because it failed to offer habeas procedural protections. Under the act, the detainees had the right to challenge their designation as enemy combatants in the Court of Appeals for the District of Columbia, such designation having been made by a military panel called a Combatant Status Review Tribunal. The detainee was given a "personal representative" assigned by the military but no defense lawyer, and the tribunal was not required to disclose to the detainee the evidence or witnesses against him. If he did appeal to the D.C. court, the presumption was that the evidence was accurate and complete. The detainee was not permitted to present evidence in his favor that had been withheld from the record of the tribunal or was learned subsequent to the tribunal's determination. The tribunal's own fact-finding ability was so limited as to present considerable risk of error, thus requiring full-fledged scrutiny on appeal. The Court also viewed the cases of detainees housed at Guantanamo as exceptional, given the length of the Global War on Terrorism; the fact that it was among the longest wars in American history made it necessary to avoid any further delay, therefore rendering these cases exceptional and requiring no

further delay. The Court concluded by mentioning its importance in saying what the law is as opposed to the political branches of government. The dissenters thought the decision was overreaching and might be considered judicial activism, and that our procedural protections for the detainees were generous. There was one more case involving the military in 2008, but it did not concern the Global War on Terrorism. In *Winter v. Natural Resources Defense Council* (2008), the court narrowly rendered a decision that narrowly lifted lower court restrictions on submarine training exercises off the coast of southern California that may harm marine mammals. The restrictions required the navy to suspend the use of sonar if it detected a marine mammal within 2,200 yards and to reduce sonar levels when water temperature reached certain levels whether or not animals were present. The Court concluded that it must give great deference to the professional judgment of military authorities in these situations, and it emphasized the importance and difficulty of sonar training exercises. It also said that the extent of harm to the mammals was sharply disputed, although even given considerable harm, those injuries are outweighed by the public interest and the navy's interest in effective, realistic training of its sailors. In a dissent joined by Justice Souter, Justice Ruth Bader Ginsberg argued that the navy violated the National Environmental Policy Act, which requires the government to prepare environmental impact statements before undertaking major actions that will affect the environment. Because the navy did not obtain permission from Congress to bypass the National Environmental Policy Act's requirements, Justice Ginsberg found that the district court had imposed appropriate measures to mitigate harm until completion of the environmental impact statements.

In 2009, the Court, rendering a unanimous decision in *Porter v. McCollum*, passed a ruling that the failure of the defense lawyer in a death penalty case to present evidence of the trauma suffered by George Porter in the Korean War requires a new sentencing hearing. If evidence is available concerning posttraumatic stress disorder resulting from military service, it must be presented. The Court-appointed lawyer in the penalty phase in this case did not interview any of his client's relatives nor did he obtain any school, medical, or military service records. Had he done so, the justices held, he would have found out that his client had performed "heroic military service in

two of the most critical—and horrific—battles." Moreover, the jury might have imposed a different sentence had they been told of "the intense stress and emotional toll" that combat had taken on Porter.

Conclusion

The results of Supreme Court cases involving the military have been mixed. Recent decisions by the Court regarding the Global War on Terrorism indicate that the Court seeks to ensure that the Bill of Rights, in particular the right to due process of law, is observed by the executive and legislative branches. The decisions are not pro-military or antimilitary. Rather, they are checks on perceived excesses of the other two branches. How these matters will play out in the future is hard to tell, because the Court changes its perspective over the years as justices retire and new ones are appointed. The one constant is that the Court's decisions, whether supported or opposed, are closely observed as they are part of the rule of law on which U.S. actions are based.

U.S. TRANSPORTATION COMMAND

The U.S. Transportation Command (USTRANSCOM or TRANSCOM) is one of the U.S. Department of Defense's (DOD's) nine unified combatant commands. Commanded by a four-star general, TRANSCOM coordinates and executes the deployment of forces to wherever they are required worldwide. The command synchronizes and executes the strategic movement of all U.S. forces globally by directing the entire joint deployment and distribution enterprise to

project strategic national security capabilities worldwide and to provide end-to-end distribution process visibility and responsive support to U.S. government, multinational, and nongovernmental force projection requirements. Headquartered at Scott Air Force Base in Illinois, the command consists of three component commands: (1) the air force's Air Mobility Command, (2) the navy's Military Sealift Command, and (3) the army's Surface Deployment and Distribution Command. TRANSCOM also coordinates missions worldwide through its commercial contract partners.

The DOD assigns four primary missions to TRANSCOM:

1. Provide common-user and commercial air, land, and sea transportation; terminal management; and aerial refueling to support the global deployment, employment, sustainment, and redeployment of U.S. forces.
2. Serve as the mobility joint force provider and, in coordination with the services and other combatant commanders, identifying and recommending global joint sourcing solutions to the chairman of the Joint Chiefs of Staff, and supervising implementation of sourcing decisions.
3. Provide DOD global aeromedical patient movement, in coordination with geographic combatant commands, through the defense transportation system.
4. Serve as the distribution process owner, coordinating and overseeing the DOD distribution system to provide interoperability, synchronization, and alignment of DOD-wide, end-to-end distribution, and developing and implementing distribution process improvements that enhance the defense logistics and global supply chain management system.

TRANSCOM commands and directs a massive fleet and workforce worldwide. The command directly controls a \$52 billion worldwide fleet of military assets, including 87 ships, more than 1,200 aircraft, more than 2,100 railcars, and \$1.4 billion worth of infrastructure. Through its commercial partners, TRANSCOM also directs an additional 1,000 aircraft and 360 ocean vessels. Its total workforce includes more than 51,000 active-duty military personnel, more than 88,000 guard and reserve personnel, and more than 16,000 civilian personnel.

TRANSCOM relies on its commercial partners to meet 88% of continental U.S. land transport, 50% of global air movement, and 64% of global sealift.

During a typical week, TRANSCOM will conduct more than 1,900 air missions, have 25 ships under way, and have more than 10,000 ground shipments operating in more than three quarters of the world's countries. It controls this worldwide enterprise through a technically advanced enterprise with a goal of seamless, integrated, end-to-end deployment and distribution under a single unified combatant commander during both peace and war. TRANSCOM executes missions through its three component subordinate commands, each with worldwide responsibilities.

The air component of TRANSCOM is Air Mobility Command (AMC), headquartered at Scott Air Force Base. AMC provides strategic and tactical airlift, air refueling, and aeromedical evacuation services for deploying, sustaining, and redeploying U.S. forces wherever they are needed globally. Many special duty and operational support aircraft are also assigned to AMC (including Air Force One). In addition, AMC contracts with commercial air carriers through the Civil Reserve Air Fleet (a fleet of commercial aircraft committed to support the transportation of military forces and material in times of crisis) and other programs for movement of DOD passengers and cargo. AMC's air fleet provides swift response as an element of America's global reach. Aircraft assets of the command include C-17 Globemaster III, C-5 Galaxy, C-141 Starlifter, KC-135 Stratotanker, KC-10 Extender, and C-9 Nightingale.

Military Sealift Command is TRANSCOM's sea component. Headquartered in Washington, D.C., Military Sealift Command uses organic U.S. Navy vessels as well as contract commercial ships to move unit equipment and sustainment supplies to and from theaters of operation worldwide in both peace and war. Including contracted vessels, Military Sealift Command frequently has more than 400 ships under way each day.

The third component of TRANSCOM is the Surface Deployment and Distribution Command at Scott Air Force Base. It is the overland and surface distribution command and manager for TRANSCOM. Surface Deployment and Distribution Command maintains a permanent presence in more than 20 ports worldwide. It manages the movement of more than 3.7 tons of ocean cargo, 500,000

personal property moves, 600,000 domestic freight shipments, 72,000 privately owned vehicles, and more than 500,000 passengers annually.

In 2003, TRANSCOM was named the distribution process owner for DOD. This makes TRANSCOM the single entity to direct and supervise execution of the strategic distribution system from fort to port. The command also manages the supply chain information technology systems and has the authority to establish a contracting activity for procurement of required commercial transportation services.

TRANSCOM was created in 1987 in accordance with the provisions of the Goldwater-Nichols Department of Defense Reorganization Act of 1986. The creation of a unified transportation command was in response to various joint exercises in the 1970s and 1980s that revealed a need for such a command.

The command first proved its worth during the Persian Gulf War (1990–1991) when TRANSCOM executed one of the largest deployments in history. The command moved more than 500,000 passengers, 3.7 million tons of dry cargo, and 6.1 million tons of petroleum products in a little more than 7 months. This is the equivalent of deploying and sustaining 2 army corps, 2 Marine Expeditionary Forces, and 28 air force tactical fighter squadrons. There is no comparable movement in such a short time in world history.

TRANSCOM has been involved in every contingency operation since its inception. This includes missions as varied as humanitarian relief operations, combat deployments, and evacuation of wounded soldiers. As a vital participant in the current conflicts worldwide, TRANSCOM has moved more than 2.2 million passengers and nearly 6.1 million tons of cargo.

Possessing the most capable, modern, and proven air, land, and sea strategic mobility forces in the world, TRANSCOM is the backbone of the nation's strategic mobility system.

USA PATRIOT ACT

The USA PATRIOT Act was signed into law on October 26, 2001, after the shock of the 9/11 attacks on the Pentagon and the World Trade Center. The title of the law stands for Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act of 2001, although it is typically referred to as the Patriot Act. Sunset provisions in the original law called for the expiration of many of the act's features at the end of 2005. Congress has since reauthorized the Patriot Act twice, in 2006 and 2011.

The law is divided into 10 titles. Title I (titled "Enhancing Domestic Security Against Terrorism") expanded the authority of the Federal Bureau of Investigation in regard to terrorism investigations. Title II ("Enhanced Surveillance Procedures") focused on expanding the federal government's surveillance capabilities, including its authority to intercept wire, oral, and electronic communications in order to conduct terrorism investigations. Controversy surrounded the allowance for government authorities to gather foreign intelligence from U.S. and non-U.S. citizens alike. Title III of the act focused on the prevention of money laundering and currency crime activity designed to aid terrorism. Title IV enhanced the powers of the U.S. attorney general and what was then known as the Immigration and Naturalization Service in regard to U.S. border security. Title V focused on removing obstacles to investigating terrorism (i.e., extension of Secret Service jurisdiction; e.g., one of its provisions extended Secret Service jurisdiction). Title VI amended the Victims of Crime Act of 1984 to update the administration of the

Victims of Crime Fund. Title VII's provisions dealt with increased information sharing for critical infrastructure protection. Title VIII ("Strengthening the Criminal Laws Against Terrorism") defined terrorism as an action or actions that endanger "human life . . . [and] are a violation of the criminal laws of the United States or of any State" with the goal to "intimidate or coerce a civilian population." Title IX ("Improved Intelligence") mandated that the director of central intelligence and the attorney general of the United States cooperate to share relevant intelligence information. Title X is a catch-all provision focused on miscellaneous laws that did not fit into other titles of the act, such as defining electronic surveillance, limiting the issuance of hazardous materials licenses, and protecting critical infrastructure. Congress overwhelmingly approved the passage of the Patriot Act (by a 98–1 vote in the Senate and 357–66 vote in the House). Support for the measure was bipartisan, which was thought to be at least in part due to the horror and fear engendered by the 9/11 terrorist attacks. As stated on its website, the Department of Justice takes the position that the act allowed tools already available for investigating organized crime and drug trafficking to be used in terrorism investigations. According to the Justice Department, "roving wiretaps," authorized for a person instead of a single communications line or device, had been used for years to investigate drug crimes and racketeering. These wiretaps could now be used under the act to investigate terrorism suspects. The act upheld the right of the law enforcement authority to investigate suspected terrorists without tipping them off early in the process. Notice would have to be given to the suspect or suspects, but with a "reasonable delay" as allowed by federal court review. Federal authorities under the act could now seek a court's permission to examine business records relevant to the investigation of terrorism cases.

The Supreme Court has upheld key provisions of the law. In *Holder v. Humanitarian Law Project* (2010), the Court upheld the Patriot Act's prohibition on offering material support to groups designated by the government as terrorist in nature. President Barack Obama signed legislation reauthorizing the Patriot Act on May 26, 2011, for an additional 4 years. It would therefore appear that key parts of the act are likely to continue indefinitely into the future, albeit with some modifications reflecting Supreme Court cases on the matter since

the act's initial passage. The act continues to have a greater impact on domestic law enforcement authorities than the military because of the original intentions of the legislation. A major concern continues, however, over the issue of precisely how information is shared by intelligence agencies with military and national security authorities.

The Justice Department and other supporters of the Patriot Act also argue that it helps domestic law enforcement, intelligence, and national security agencies share information about suspected terrorist activities. The firewalls that existed among these agencies in the past, preventing the sharing of information, lessened after passage of the act. The Justice Department also claims that the act merely updates the law to deal with new technologies and threats posed by "digital age" international terrorism. Search warrants concerning terrorism-related activities are easier to obtain by law enforcement agencies under the act. Such warrants can now be obtained in whatever district terrorist activity is alleged to have occurred, regardless of where the warrants will be executed. Finally, the Justice Department maintains that the Patriot Act justly increases the punishments for those who are found guilty of terrorist crimes (including those who aid and abet terrorists).

Critics of the Patriot Act argue that it unnecessarily violates the individual rights of American citizens. Prominent political figures, including the former vice president Al Gore, called for the repeal of the act after its passage on these grounds. The former presidential candidate Howard Dean called for repeal of part of the act. Librarians criticized the act on the grounds that they could be asked to deliver to law enforcement agencies detailed records of their patrons' information requests. Other critics argue that wartime emergencies have often been used in American history to justify the growth of overweening government power at the expense of individual liberties. Such critics point out the example of the damage done by Abraham Lincoln's abrogation of habeas corpus during the Civil War and by the Franklin D. Roosevelt administration's forcible internment of Japanese Americans during World War II. The fear engendered by foreign threats can lead to a governmental emphasis on security at the expense of liberty. Even when the foreign threat ends, critics contend, the precedent of expanded police powers remains in peacetime conditions.

During the 20th century, the United States lost the “free security” once provided by the Atlantic and Pacific oceans as intercontinental ballistic missile and bomber technology developed. The asymmetrical threat posed by Islamic terrorism in the aftermath of the Cold War arguably made Americans feel even more vulnerable than they had been during the Cold War. The 9/11 attacks intensified concerns about terrorism for many Americans. Terrorism has caused a rethinking of the boundaries between domestic law enforcement and national security operations. The Patriot Act reflects this change in the perceptions of Americans about themselves and the world of the 21st century.

VENEZUELA

Venezuela is located at the northern rim of South America, and it is bordered to the north by the Caribbean Sea and the Atlantic Ocean. Its capital city, Caracas, is centrally located near the Caribbean coast and is the center of gravity in terms of population and politics. More than 90% of Venezuela's 27 million people live in urban areas, with more than 3 million of them living in Caracas. Significant economic activity related to the country's status as a major oil producer and exporter is located outside Caracas, near the oil fields in the states of Zulia in the west and Barinas in the east. This entry briefly reviews the history of Venezuela since the mid-20th century, the evolution of the armed forces under President Hugo Chávez, and the implications for relations between Venezuela and the United States.

Recent History

Venezuela became a democracy in 1958, and although it struggled against a leftist insurgency during its first democratic decade, it survived the wave of right-wing authoritarianism that swept the region during the 1960s and 1970s. Indeed, as a major oil producer, Venezuela prospered during the oil boom of the 1970s and established itself as a leader in the Organization of Petroleum Exporting Countries. Domestically, Venezuela undertook ambitious economic development projects, including the nationalization of the oil industry, the construction of major state-owned enterprises, and the expansion of the middle class through

government spending, cheap imports, and subsidized prices for food and energy. Venezuela's rapidly rising government spending included investment in military modernization, transforming the armed forces from an institution largely focused on counterinsurgency operations to a conventional force that operated French main battle tanks, Italian guided missile frigates, and French Mirage and U.S. F-16 fighter aircraft.

As the boom fizzled out during the 1980s, Venezuela found itself mired in economic stagnation produced by high spending and low oil prices, leading to substantial foreign debt. Attempts to address the crisis by moving toward free market policies produced a decade of political turmoil. Venezuela experienced mass urban rioting in 1989, two coup attempts in 1992, and the impeachment of a president in 1993. The highly contested presidential elections of 1998 resulted in the selection of an outsider candidate, the 1992 coup leader Hugo Chávez Frias. Chávez advocated a progressively more radical political agenda centered on the promotion of participative democracy; the deepening of state leadership of the economy, including government ownership of growing numbers of industries and agricultural enterprises; and the promotion of "Bolivarianism," an ideology based on a leftist reinterpretation of the thinking of the Venezuelan independence leader Simón Bolívar. Relations with the United States deteriorated, and a close alliance developed with Cuba.

The Venezuelan Armed Forces

The Venezuelan armed forces were transformed during the presidency of Chávez. They are now a

much more politicized institution that is oriented mainly toward social programs and internal security rather than external defense. The military traditionally consisted of an army, a navy, an air force, and a gendarmerie—named the Guardia Nacional Bolivariana—but now, it includes a militia answering directly to the president. While the traditional branches may have 163,000 active-duty and 100,000 reserve personnel, the addition of the Bolivarian militia makes it difficult to determine the true size of the armed forces. The government claims that there are hundreds of thousands of militia members, but it is thought that the number of those with substantial military training may be much lower, perhaps 10,000 to 20,000.

President Chávez had explicitly brought the military into his overall Bolivarian project of integrating society and the armed forces. This initially produced a split within the military between those enthusiastic about a new social development role and those who sought to retain their traditional defense role. This paralleled the growing tensions between pro- and anti-Chávez forces in society. The resulting political crisis produced popular mobilization against the government, a failed coup attempt in 2002, a strike by the oil industry in 2003, and a recall referendum against the president in 2004. Chávez adeptly used these as opportunities to purge officers who opposed him and to reward his supporters. In subsequent years, the armed forces have been loyal to the government. To ensure that this continued, he had institutionalized a direct form of presidential control over the armed forces and formed a Bolivarian militia, manned by his supporters, that was designed to defend the regime from opponents, including those remaining in the military.

U.S.-Venezuelan Relations

Since the early 20th century, the United States has influenced Venezuela through its participation in the development of petroleum production and through the tens of thousands of U.S. citizens who worked in this industry. On a personal level, many Venezuelans viewed the United States favorably, but intergovernmental relations have been more formal, especially during the democratic period (1958–1998). This was due to disagreements over oil policy—since Venezuela favored the Organization of Petroleum Exporting Countries and a stronger

government role in the industry—and over foreign policy, where Venezuela occasionally opposed the U.S. approach to the Cold War in Latin America, basing its foreign policy more on the promotion of democracy and regional solidarity than on opposing Soviet influence.

After 1941, the United States became the predominant source of military doctrine and training, reflecting Venezuela's sympathy for the Allied cause during World War II. During its counterinsurgency struggle in the 1960s, Venezuela also hosted the largest U.S. military assistance group in South America. Despite the acquisition of weapons systems from Italian, French, and other foreign manufacturers, U.S. military influence on Venezuelan training and doctrine remained strong, with a considerable number of Venezuelan military personnel training in the United States and a significant number of U.S. officers participating in personnel exchange programs with Venezuela.

However, during the Chávez period, U.S.-Venezuelan relations fell to a historic low. President Chávez repeatedly accused the United States of interference in Venezuelan politics and even of planning an invasion. Many in the U.S. government saw Venezuela as an uncooperative neighbor at best and an exporter of radicalism and anti-Americanism at worst. Under such circumstances, military-to-military contacts have collapsed. The United States has refused to supply spare parts for Venezuela's existing arsenal, and it has prevented most Western countries from supplying equipment. Instead, Chávez sought military training and equipment from Cuba, China, and Russia, including billions of dollars in new acquisitions.

The death of Chavez from cancer in March 2013 raises questions about his legacy for Venezuela and its relationship with the Western Hemisphere. As a sign of his close relationship with Cuba, Chavez went to Cuba for medical treatment in his 2-year struggle with cancer. He left a nation deeply fractured politically, economically, and socially. His vice president, Nicolas Maduro, narrowly won election as president in his own right several weeks after Chavez's death. Whether Maduro can maintain the grip on political power given the fragile nature of the economy that stems in part from falling oil production remains to be seen.

VETERANS AFFAIRS, DEPARTMENT OF

The Department of Veterans Affairs (VA) administers benefits for servicemen and servicewomen who served in the armed forces of the United States. In 2012, the VA served a veterans population of more than 20 million veterans through 817 outpatient clinics, 152 hospitals, 300 veteran centers, and 56 regional benefit centers. It maintains a network of 131 national cemeteries, which contain the remains of servicemen and servicewomen who died in every American war. More than 7 million veterans hold a life insurance policy, and nearly 3½ million receive

disability or old-age pension through the organization. The agency has more than 300,000 employees, the second largest number among federal departments, only trailing the Department of Defense. The VA expended slightly more than \$140 billion in 2011.

Organizational Development

After the Civil War, the centerpieces of veterans' benefits were disability pensions and institutional care for disabled ex-soldiers. After gradual expansion, Civil War pensions for Union veterans (but not Confederate veterans) represented more than a quarter of the government's expenditures between 1880 and 1910; disbursement was administered by the Bureau of Pensions in the Department of the Interior. In the peak year of expenditure—1893—the Bureau of Pensions served more than 1 million pensioners.

When the U.S. entered World War I, President Woodrow Wilson and reformers sought to avoid creating another class of pensioners. To deal with the veterans' disability and the needs of dependents of wounded or killed service people, the government created a system of War Risk Insurance for the 4 million Americans serving in the armed forces. To meet the needs of veterans with service-related wounds and disabilities, a network of hospitals was created under the jurisdiction of the Public Health Service, before being absorbed into the newly created Veterans' Bureau in 1921. The Veterans' Bureau was mired in scandal under the administration of Warren G. Harding; the appointment of General Franklin T. Hines played an instrumental role in restoring credibility to this agency. In an effort to bring about greater efficiency, President Herbert Hoover created the Veterans Administration and folded the Bureau of Pensions, the National Homes for Disabled Volunteer Soldiers, and the Veterans' Bureau into this single agency. Hines continued in office under President Franklin D. Roosevelt, only retiring in 1945. Hines established a pattern that would be continued by other presidents and a number of retired generals, most notably General Omar Bradley, served as head of the VA.

World War I veterans believed that they had been unfairly denied a bonus, a cash payment for their service to compensate them for the low wages paid to those in uniform. Every president from Harding

to Roosevelt opposed the payment of the bonus. In 1924, Congress agreed to pay a bonus to these veterans after intense lobbying from the Veterans of Foreign Wars and strong grassroots pressure. Under the Adjusted Service Certificate Law of 1924, the bonus would be paid in 1945. During the Great Depression, many veterans mired in poverty and unemployment sought an early payment of the bonus and marched on Washington, D.C. Styling themselves the Bonus Expeditionary Force, these veterans created encampments near the Capitol, hoping to pressure Congress to provide an early payment. Hoover ordered the U.S. Army, under General Douglas A. MacArthur, to evict the demonstrators from downtown Washington, D.C. However, the first Administrator of Veterans Affairs, Hines, rejected the payment of an early bonus. An early bonus would be distributed only after Congress overrode the veto of Roosevelt in 1936.

Even before World War II ended, there existed a strong sentiment within the Roosevelt administration and with the most politically influential veterans' organization, the American Legion, that the federal government must develop government programs to help the 15 million men and women serving in uniform reintegrate into society. The American Legion also sought to promote the interests of World War II veterans in order to stay relevant to this newest generation of veterans. The resulting G.I. Bill of Rights of 1944 is widely considered to be one of the most progressive pieces of legislation ever passed by Congress. In contrast to earlier wars, the G.I. Bill created an array of programs explicitly targeting able-bodied veterans. The VA struggled to administer the diverse range of programs mandated by the G.I. Bill, which included (a) educational allowances; (b) unemployment compensation; (c) home, farm, and business loan guarantees; and (d) job placement service for returning World War II veterans. For instance, veterans seeking disability status and payments often had to wait months, even years, for the VA to make a final decision. Veterans attending college often had to contend with late payment of living allowances. Under the leadership of Bradley a number of major administrative changes were undertaken, including efforts to expand the agency's hospital system and affiliate it with medical schools to improve the quality of care.

Veterans' organizations would play a crucial role in lobbying on behalf of the VA and came to form a

potent political force in Washington. The American Legion, Veterans of Foreign Wars, and Disabled American Veterans attracted significant support from veterans of the two World Wars. The clout of the VA would be reflected in its effort to defeat attempts by President Jimmy Carter to end veterans' preferences for federal employment. In 1989, veterans successfully lobbied for the VA to be elevated to cabinet status, and President Ronald Reagan signed confirming legislation, even though he had come into office with a pledge to shrink the federal cabinet by eliminating the departments of Education and Energy. Veterans of Vietnam and later wars have joined veterans' organizations in fewer numbers; as organizations like the American Legion and Veterans of Foreign Wars shrink in size, the VA may struggle in Congress to receive the appropriations it needs to care for not only the needs of aged veterans of World War II, Korea, and Vietnam but also the needs of younger veterans from the wars in Afghanistan and Iraq.

Services

Organizationally, the VA is divided into three subdepartments: (1) the Veterans Health Administration maintains the largest single medical system in the United States and rivals the national health service of many industrialized countries; (2) the Veterans Benefits Administration administers a range of non-medical benefits, including disability payments, educational assistance, and group life insurance; and (3) the National Cemetery Administration maintains a network of cemeteries for veterans and provides monetary grants for the burial of deceased veterans. VA services are generally available only to veterans who were honorably discharged and meet other qualifying criteria.

Since the beginning of the American Republic, there has been a national consensus that the wounded, the disabled, the widowed, and the orphaned should be cared for by the nation. The VA administers programs to provide financial support for disabled veterans and survivors' benefits for widows and orphans. Although VA programs for the disabled enjoy broad ideological support, for decades the VA has come under fire for its overly bureaucratic processes in administering them. The question of what qualifies as a service-related disability has been a subject of dispute for years, with

critics arguing that the VA, in dealing with medical issues associated with Agent Orange, Gulf War Syndrome, and Traumatic Brain Injury, has often taken too narrow a definition of what constitutes a war-related injury. Until the 2000s, veterans could not retain the services of an attorney to assist with filing a veterans claim, under Civil War legislation that limited attorney fees to \$10. Veterans groups have played important roles in serving as ombudsmen for veterans filing claims with the federal government, and most organizations offer the services of service officers free of charge to veterans and their families.

Even with the expansion of the federal programs in the areas of education, health, and welfare, veterans programs still have a significant impact on American society. Educational benefits to veterans are the largest single source of financial aid to college students. With the rise of the all-volunteer army in the 1970s, the promise of financial support for college has been a major inducement for enlisting young men and women into the army. The post-9/11 G.I. Bill, authored by Senator James Webb of Virginia, provided increased benefits for veterans of the wars of Afghanistan and Iraq—the most generous educational benefits accorded to veterans since the original G.I. Bill of Rights of 1944.

The range of services offered to veterans are extensive and include (a) low-cost life insurance, (b) assistance in purchasing a first home, (c) provisions for unemployment insurance, and (d) medical care. Despite this array of services, the needs of a significant number of veterans have not been met in their efforts to successfully reintegrate back into American society. In the early years of the Afghanistan and Iraq Wars, neither the Defense Department nor the Veterans Administration effectively managed the transition of wounded warriors from the military system to the civilian one. Veterans of these recent conflicts experienced higher rates of unemployment and homelessness during the Great Recession of 2007. For those attending college, there is a significant attrition rate before completing their degrees.

No other major industrialized nation provides as wide-ranging a network of services exclusively reserved for veterans as the United States. Instead, most First World countries have opted to create expansive welfare states to care for all citizens, including veterans. The VA and the programs it administers stand as a unique testament to the

determination of American society to care for the men and women who served in the armed forces.

VETERANS OF FOREIGN WARS

The Veterans of Foreign Wars (VFW) is an organization open to all military personnel earning service badges for participation in U.S. overseas military campaigns. Founded after the Spanish-American War, the VFW serves as a fraternal association dedicated to the welfare of American veterans and their families. To that end, the VFW provides several services for veterans: (a) as advocates for federal veterans legislation, (b) as an intermediary between individual veterans and the veterans bureaucracy, and (c) in perpetuating the bonds of camaraderie associated with military service. Since its inception, the VFW also has voiced veterans' perspectives on U.S. national security and military issues. Throughout the 20th century, the VFW joined with other patriotic organizations to champion unswerving dedication to the political

institutions of the United States through antiradicalism initiatives known collectively as the Americanism program. Moreover, the organization helped develop and maintain the nationalist rituals of the United States, including the building of war memorials and commemorations of the nation's military heroes. By reaching out to thousands of communities across the country through local units called posts, the organization effectively mediates overseas veterans' relationship with the rest of American society.

Origins and Early Years

The VFW traces its origins to veterans groups of the Spanish-American and Philippine-American Wars that formed in 1899: (a) the National Association of the Army of the Philippines and (b) the American Veterans of Foreign Service. These groups formally merged in 1913 and consolidated in 1914 under the banner of the Veterans of Foreign Wars of the United States. The organization adopted as its insignia the Cross of Malta, signaling parallels between the organization and the crusading Knights Hospitallers. After 1914, the VFW opened its membership to all honorably discharged veterans who had served on foreign shores or in hostile waters in any war, campaign, or expedition—recognized by Congress with a campaign badge or service clasp. Nevertheless, the organization remained quite small until the U.S. entry into World War I, with only 5,000 members as late as August 1916.

U.S. participation in World War I transformed the visibility and reach of the VFW. The VFW opened its doors to some 2 million potential new members of the American Expeditionary Force sent to France. In 1916, the VFW national encampment voted to recruit active-duty soldiers, not just discharged veterans, to help build up membership. After 1917, the VFW waived membership fees for active-duty military personnel and heavily recruited from the American Expeditionary Force camps in France. While the VFW membership would grow to 20,000 members by 1919, it became completely overshadowed in the immediate postwar period by the organization's new rival for Great War veterans, the American Legion.

The 1920s and 1930s

During the 1920s, the VFW expanded its activities even though the American Legion eclipsed the organization in membership and political clout by a large margin. The two organizations worked

in tandem, however, to provide veterans benefits, including adequate medical care and pensions for physically and psychologically disabled veterans, vocational rehabilitation, and sufficient provisions for the widows and orphans of the war dead. In 1921, as a way to concentrate its lobbying strength, the VFW established a National Service Bureau in Washington, D.C., to promote veterans' interests.

In the decade of the 1920s, the VFW undertook several initiatives beyond the scope of veterans legislation. After 1919, the VFW began its Americanism program to promote the virtues of American culture and American political institutions as a way to undermine radicalism and "hybrid" ethnic identities. In 1922, the VFW initiated the annual Buddy Poppy drive, trademarking it in 1924. Since 1922, lapel-pin poppies have been sold by VFW members on Memorial Day to benefit disabled veterans and to remind Americans of the costs of war. Throughout the late 1920s, the VFW also sponsored legislation in Congress that would make Francis Scott Key's "Star-Spangled Banner" the official national anthem of the United States. In 1931, this drive finally succeeded. Throughout the decade of the 1920s, however, the VFW remained a secondary player on the issues affecting Great War veterans.

Bonus for World War I Veterans

Both the VFW and the American Legion lobbied for the payment of a bonus to World War I veterans as "adjusted compensation" for the meager wages received during the conflict. In 1924, Congress passed and put into effect, over President Calvin Coolidge's veto, a deferred bonus payment for Great War veterans in the form of an interest-bearing certificate payable in 1945.

In 1929, the VFW's fortunes turned when it began a concerted push for non-service-connected pensions for disabled World War veterans and for prepayment of the bonus. The efforts initially bore fruit as Herbert Hoover signed into law in 1930 a new non-service-connected pension for disabled veterans. This expansive and expensive program, however, lasted only 3 years as the 1933 Economy Act, championed by Franklin D. Roosevelt, eliminated these forms of pensions entirely in a drastic federal cost-cutting measure. The VFW, however, began to mobilize against the Roosevelt administration immediately and helped reinstate some of the most egregious cuts in veterans' pensions to the service-connected

disabled. Moreover, from 1929 to 1936, the VFW grew precipitously as a result of the organization's leadership in securing immediate cash payment of the bonus. From 1932 to 1936, the VFW never wavered in its support of immediate cash payment, a position that brought it into direct confrontation with both Hoover and Roosevelt. The VFW even played an important role in the origins of the 1932 Bonus March by continually fighting for immediate payment of the bonus in a period when the American Legion opposed the measure. The VFW's populist message in the 1930s brought the organization enormous institutional gains and placed it in the middle of Depression-era politics, especially the dissenting politics associated with Huey Long and Father Charles Coughlin. To be sure, the VFW never challenged the primacy of the American Legion as the largest veterans organization. But between 1929 and 1936, the VFW surged from fewer than 70,000 to 300,000 members, despite the fact that the Depression wreaked havoc on most dues-paying voluntary associations. In 1936, Congress granted veterans their bonus payment and the VFW a congressional charter in recognition of the organization's newfound national stature.

World War II and the Postwar Period

World War II brought new missions and a new infusion of members into the VFW. During the 1930s, the VFW joined with those in favor of isolationism and promoted strict neutrality in world affairs. After 1940, the VFW supported the slow drift toward war, including the massive military mobilization and the peacetime draft. With the Japanese attack on Pearl Harbor, the organization vigorously joined the war effort. VFW members served as civil defense personnel and training camp instructors. In 1942, the VFW instituted a pilot-training program that prepared new recruits desperately needed for flying duty in the armed services. Moreover, in 1944, the VFW became involved in the legislative battle over the proper manner in which to compensate returning veterans and ease their readjustment into civilian life. The VFW initially opposed the expansive benefits that were outlined in the Servicemen's Readjustment Act, more popularly known as the G.I. Bill, out of fears that such an expansive system was sure to be gutted in another "Economy Act." Ultimately, the VFW joined with the bill's sponsor, the American Legion, in helping secure the legislative victory of the G.I. Bill, one of

the most expansive pieces of social welfare legislation in the country's history, which provided education, housing, and job training to millions of veterans. VFW local and state officials proved instrumental in implementing the bill as the organization aided veterans in navigating the federal bureaucracy to secure their benefits. By the end of World War II, the VFW stood with the American Legion as the twin pillars of the formidable veterans lobby.

After World War II, the VFW stood at its greatest political and numerical strength, with some 1.5 million members. During the Cold War, the VFW continued the organization's record of staunch anticommunism begun in the years following the Bolshevik Revolution. In the waging of the Cold War,

from the U.S. involvement in Korea to Vietnam, the VFW supported an aggressive and militant foreign policy for the United States in battling communism. Even when public support for the Vietnam War waned, the VFW never wavered in its opinion of the war's merits or of American soldiers' honorable service. From World War II through the Vietnam conflict, the VFW attempted to account for, and repatriate, prisoners of war and soldiers missing in action. After the Vietnam War, the search for living prisoners of war and soldiers missing in action and the attempts to identify the remains of the unidentified dead became an even larger VFW project as it worked with the U.S. government and the governments and private citizens of Korea and Vietnam.

A U.S. veteran and member of the Veterans of Foreign Wars salutes during the Memorial Day commemoration ceremony at the Arlington National Cemetery in Arlington, Virginia, May 30, 2011. The Veterans of Foreign Wars traces its roots back to 1899, when its mission was to "honor the dead by helping the living" through veterans and community service, national security, and a strong national defense. Memorial Day is an honored day of remembrance for those who have died in the service of the nation.

The Vietnam War

Since the Vietnam War, the VFW has maintained its active position in veterans' affairs. Despite the VFW's support for the war, it became an outspoken critic of the Veterans Administration's handling of Vietnam veterans' posttraumatic stress disorder and of the physical ailments tied to the exposure of the chemical defoliant Agent Orange. In these battles, the VFW struggled with the Veterans Administration and military bureaucracies before finally securing treatment and compensation, respectively. After the Persian Gulf War in 1991, the VFW sought to find answers to why American veterans were succumbing to a debilitating but mysterious illness. The VFW supported research into what came to be called the Gulf War syndrome and challenged the U.S. military to provide information on the vaccinations given to the troops and the possible reasons behind the illness. The post-Vietnam era also found the VFW very active in supporting public memorials for the veterans of the Korean and Vietnam Wars and World War II. Three new memorials on the Washington Mall were dedicated in 1995, 1982, and 2004, respectively.

September 11, 2001, and Beyond

After the attacks of September 11, 2001, the VFW championed the wars in Afghanistan and Iraq as part of the struggle against terrorism. These campaigns created hundreds of thousands of new potential members for the organization, but the VFW harshly criticized the U.S. government's treatment of soldiers and veterans. The VFW demanded that the government provide more material support, especially improved safety features, for the nation's military; blasted the Pentagon for inadequate hospitals and medical care for returning wounded veterans; and sponsored legislation that would create a new, expansive G.I. Bill for veterans of these conflicts. On June 30, 2008, the bill was passed into law and replaced the inadequate Montgomery G.I. Bill, paying the highest in-state public tuition rate and providing books, fees, and a living stipend. At that time, the VFW counted 2.3 million men and women veterans as members, the latter becoming eligible for membership only in 1978.

Throughout the history of the organization, the VFW national organization has been an outspoken champion of federal veterans' benefits, health care,

and pensions. At the state and local levels, VFW leaders and service officers also provide guidance to veterans of their communities who seek to navigate the veterans and military bureaucracies. In this capacity, the VFW has served as a vital intermediary between individual veterans and the federal government. The VFW brings together veterans from more than 8,000 locations across the country, where they serve their communities through charity fundraising, the granting of scholarships, the promotion of youth programs, and volunteering at Veterans Administration medical facilities and retirement centers. By sponsoring Memorial Day–Buddy Poppy drives, and parades and tributes on Memorial Day and Veterans Day, it also acts as a constant reminder of the long-term impact of war on the American people.

VIETNAM WAR

The Vietnam War remains one of the most controversial military engagements of the United States. This entry reviews the historical context of the conflict, its evolution during the 1950s and 1960s, the role of U.S. foreign policy in the conduct of the war, and the conclusion of the conflict in 1972. The entry then looks at historical perspectives on the Vietnam War and its implications for American foreign policy in the 21st century.

Origins of the Conflict

As part of its Cold War policy of containing the spread of communism, from roughly 1950 to 1975 the United States became involved in a failed attempt to prevent the unification of Vietnam under a communist system. The United States committed 3.4 million soldiers to the conflict (2.7 million serving in Vietnam), spent more than \$150 billion, and suffered more than 58,000 deaths and a further 250,000 injuries. Although the conflict was part of a broader geopolitical struggle, no understanding of U.S. involvement in the war is complete without an appreciation of Vietnamese history and the long-standing efforts of its people to stave off foreign intervention in their country. For centuries, the Vietnamese had resisted Chinese designs on their land. But during the 1880s, France took control of Vietnam and incorporated it into French Indochina. France remained in control until the outbreak of World War II. The defeat of France in Europe in 1940 greatly weakened the nation's ability to maintain control over its imperial territories. The Japanese—in an effort to expand their own empire—moved forces into Vietnam in July 1941. Seizing on the political upheaval created by the imperial power struggle, the committed nationalist Ho Chi Minh returned to Vietnam in 1940 to lead the Vietnamese independence movement. Ho had traveled widely, and while in Europe, he became greatly influenced by the anti-imperialist tenets of communism. In 1941, he formed the Vietminh as a broad-based independence group dedicated to fighting Japanese and French forces. Under the leadership of General Vo Nguyen Giap, the Vietminh waged an effective guerrilla warfare campaign until the conclusion of World War II. With Japan defeated, on September 2, 1945, Ho declared an independent Republic of Vietnam under the banner of communism. The French had other ideas and soon attempted to reestablish imperial control in Southeast Asia. In 1946, the French shelled the harbor city of Haiphong—killing thousands—in retaliation for Vietminh attacks on their soldiers. Violence on both sides escalated, precipitating the First Indochina War.

The First Indochina War

From 1946 through 1954, the French fought to reestablish their empire in Vietnam, while the Vietminh continued their guerrilla campaign of

ambushes, attacks on isolated French targets, and avoidance of head-on confrontations with the better equipped French forces. Given the United States' professed dedication to freedom and opposition to colonialism—expressed most fully in the Atlantic Charter and repeated frequently throughout World War II—Ho fully anticipated American support for Vietnamese independence. However, the U.S. response was entirely conditioned by their Cold War national security concerns. President Harry Truman's 1947 doctrine of containment pledged American support to all peoples fighting against perceived communist expansion. Consequently, even though Truman was ideologically averse to aiding a colonial power, the United States offered increasing amounts of financial aid to the French throughout the First Indochina War. By the early 1950s, the United States was underwriting nearly 80% of France's war costs. In 1950, Truman also sent a Military Advisors Group to Vietnam to provide assistance to the French—the first significant commitment of U.S. personnel to Southeast Asia. But the French were unable to break the back of the Vietnamese resistance, and tiring of a drawn-out and inconclusive engagement, they sought a climactic battle to bring an end to the war. The commander of the French forces, General Henri Navarre, chose to construct a heavily defended base near the town of Dien Bien Phu in an area of known Vietminh strength. The French hoped to draw communist forces out into the open, where the superior French firepower could inflict crippling casualties on their foe. However, Navarre underestimated the will of the Vietnamese, who dragged heavy artillery pieces up the surrounding hills and from March through May 1954 launched a wave after wave of devastating assaults on the French outpost, compelling the French to surrender.

The Division of Vietnam Into North and South

The Geneva Agreement that ended the First Indochina War divided Vietnam into northern and southern regions along the 17th parallel, with the proviso that free elections would be held in 1956 to reunify the country. Ho's communist forces controlled the North, while the South remained under the control of the Vietnamese emperor Bao Dai—a leader tainted with the reputation of having collaborated with the French while under colonial rule. Bao Dai eventually ceded power to Ngo Dinh Diem—a nationalist who enjoyed the

support of the Dwight Eisenhower administration. Most predictions—including those of the Central Intelligence Agency—indicated that the communists would comfortably win a popular vote on reunification, prompting Diem to abandon the elections. For the United States, by the 1950s, stopping the spread of communism had become the primary foreign policy goal and a near-national obsession. Influenced also by the domino theory—which suggested that if one country fell into communist hands, the surrounding countries would follow—the Eisenhower administration feared that the fate of Southeast Asia might hang in the balance in Vietnam. Consequently, the United States offered Diem millions of dollars in economic and military aid in the hope that he could prevent the communist takeover of all of Vietnam. But despite glowing press reports of Diem's achievements in South Vietnam, his regime struggled to win widespread support among the Vietnamese people. Part of the problem was that the regime was endemically corrupt, hence much

of the economic aid provided by the United States remained in the cities and never reached the rural majority in Vietnam. Further alienating him from his people, Diem was also a Roman Catholic, and he tended to promote Catholics to prominent government positions, whereas the majority of South Vietnamese were Buddhist. The resulting sectarian tensions reached a dramatic and gruesome climax when in 1963 a Buddhist monk self-immolated in front of the world's press in protest against Diem's refusal to allow celebrations of Buddha's birthday.

Opening Hostilities

The abandonment of the 1956 elections prompted more aggressive actions from the North Vietnamese communists. In 1959, Ho sent increasing numbers of communists across the 17th parallel with the goal of attacking and destabilizing the Diem regime. In 1960, these forces were joined by the indigenous South Vietnamese communist organization the National Liberation Front (NLF)—more commonly referred to in the United States as the Viet Cong. The U.S.-backed South Vietnamese forces of the Army of the Republic of Vietnam (ARVN) proved largely ineffective in stemming the growing influence of the communists in the South. The United States continued to bolster the Military Advisors Group's presence, sending more supplies and military advisors to shore up the South. In 1962, the U.S. Air Force also began Operation Ranch Hand—a program of dropping chemical defoliants on the Vietnamese countryside to deny the communists the cover of foliage. The operation lasted until 1971 and had devastating effects on the environment as well as on many Vietnamese and U.S. soldiers who came in contact with the chemicals. Despite these efforts, South Vietnam remained chronically unstable, prompting more drastic action. When ARVN officers plotted to overthrow Diem in 1963, the U.S. authorities consented. Diem and his brother were assassinated in November 1963—just 3 weeks before the assassination of President John F. Kennedy.

Escalation

At the time of Kennedy's death, the United States had more than 16,000 military advisors in South Vietnam and had spent billions of dollars on a stubbornly unstable and vulnerable state. Lyndon B. Johnson faced an agonizing decision on his accession to the

presidency—(a) to abandon the policies of his predecessors and let South Vietnam (and potentially other surrounding countries) fall, (b) to attempt to maintain the status quo, or (c) to escalate America's involvement. Surrounded by optimistic advisors such as Secretary of Defense Robert McNamara, Johnson initially continued the incremental buildup of American aid to South Vietnam. Johnson used two events to make South Vietnam's fight an American crusade. The first was the Gulf of Tonkin incident. In August 1964, Johnson used a claim by two U.S. warships—much debate remains over the veracity of the claims—that they were under attack from North Vietnamese patrol boats to ask Congress for full authority to protect U.S. personnel in Vietnam. Under

the resulting Gulf of Tonkin Resolution, Johnson stepped up bombing of the Ho Chi Minh trail—the main conduit in Laos and Cambodia through which the North Vietnamese were supplying the communists in the South. The second incident was the attack by the communists on the U.S. airbase at Pleiku in February 1965. In retaliation, Johnson authorized Operation Rolling Thunder—extensive bombing attacks on communist targets, including those in North Vietnam—and sent U.S. combat troops to protect the airbases. Although Johnson refused to formally ask Congress for a declaration of war—neither did he mobilize the U.S. military reserves—for fear of escalating the stakes and the costs of what he hoped would be a limited engagement, his actions

meant that the burden of protecting South Vietnam now fell increasingly on the United States. By 1964, the Military Advisors Group had been absorbed by Military Assistance Command Vietnam under the command of General William Westmoreland, who now assumed responsibility for devising effective tactics to keep South Vietnam from falling into communist hands. The continued ineffectiveness of the ARVN and the South Vietnamese government, along with continued communist aggression, led Johnson to commit more and more U.S. troops to the cause. With the majority of the American public still supporting the war effort, U.S. troop levels reached more than 500,000 by 1968. The United States was also joined in the fight by forces from South Korea, Australia, and other countries as part of the Southeast Asia Treaty Organization, formed in 1954 to prevent the spread of communism in Southeast Asia.

U.S. Tactics

The paramount goal of the United States was to keep South Vietnam free from communist influence. Success, therefore, was difficult to measure. With no clear battle lines or territorial gains to be won, the main barometer of U.S. success became the “body count system.” The best way for the United States to defeat the communists was to kill as many of them as possible until the communist forces were no longer able to fight. To implement this strategy, Westmoreland employed a “search and destroy” strategy. Using bases such as Da Nang and Khe Sanh as staging posts, U.S. soldiers went out on patrols into hostile territory in an attempt to draw out enemy soldiers. Helicopters from newly formed Air Cavalry units were also used extensively to drop U.S. soldiers into enemy territory for the same purposes. The idea was that once the enemy was located, the United States could inflict overwhelming casualties through their superior firepower from artillery, helicopter gunships, and close air support from airbases and offshore aircraft carriers. The tactic was extremely effective in inflicting enemy casualties. In the Battle of Ia Drang, for example, in November 1965, U.S. Air Cavalry units inflicted heavy losses on North Vietnamese and NLF forces despite being greatly outnumbered.

During his tenure as commander of Military Assistance Command Vietnam, Westmoreland favored big-unit engagements with the enemy.

However, throughout the war, this sledgehammer method was augmented by the scalpel approach of counterinsurgency. Kennedy had given special attention to the buildup of America’s Special Forces counterinsurgency capabilities. He had hoped that such limited engagements would be sufficient to eliminate the threat of communist “wars of national liberation” in developing nations such as Vietnam. Early U.S. efforts to engender allegiance toward the South Vietnamese government among the population included the use of “strategic hamlets”—a program whereby villages would be consolidated into larger communities, which, in theory, were more easy to defend against communist aggression. This program often caused friction with the Vietnamese, many of whom resented being evicted from their ancestral homes. By 1965, under the Combined Action Program, marine squads were integrated within existing village structures to help prevent enemy infiltration. In the Central Highlands, the 5th Special Forces Group embarked on an ambitious program of training indigenous Montagnard tribes to interdict the communist forces. By 1967, these more covert attempts at nation-building were consolidated under the Office of Civic Operations and Rural Development Support. This organization then embarked on programs such as the *chieu hoi*, or “open arms” initiative, which promised amnesty for any Vietnamese wishing to renounce their allegiance to communism. When this more forgiving approach failed to pacify the population, more brutal methods were often introduced. From 1965 through 1972, the Central Intelligence Agency ran the Phoenix Program, which utilized capture, torture, interrogation, and assassination in an effort to counteract NLF activities in rural communities. These brutal measures—often undertaken in response to the similar tactics of their foes—neutralized tens of thousands of communist infiltrators.

U.S. Difficulties

The task of winning the war for the United States was made somewhat more difficult by its manpower policies. For example, the decision to rotate soldiers in and out of Vietnam after a 12-month tour of duty often had a negative effect on unit cohesion. Vietnam was also fought by relatively young soldiers: The average age of the combat soldier was 20, compared with 26 for World War II soldiers (contrary to

many popular stereotypes, approximately two thirds of the combatants were enlistees and not drafted). Moreover, toward the end of the war, manpower shortages often meant that some junior officers were rushed to Vietnam from Officer Candidate School with limited training and experience. However, throughout the war, U.S. soldiers tended to fight well and fared extremely well in direct engagements with the enemy: Indeed, the biggest obstacle to a U.S. victory in South Vietnam had less to do with the combat effectiveness of American and South Vietnamese forces and far more to do with the strategic advantages of their opponents.

As they had done against the French, the communists' guerrilla tactics proved highly effective. The NLF infiltrated South Vietnam's peasant communities, gaining new recruits all the time and making it increasingly difficult for American soldiers to distinguish their foes from those people for whom they had pledged to fight. They inflicted demoralizing casualties on American soldiers through the use of ambushes and booby traps, many of which they devised from unexploded U.S. ordnance. The massive bombing efforts of the United States were mitigated, in part, by (a) the sparse and rural nature of enemy targets, (b) the use of underground tunnels by the communist forces, and (c) the sophisticated anti-aircraft weapons systems supplied by China and the Soviet Union. Johnson was also fearful of widening the war in Southeast Asia or potentially drawing China into the conflict and so prohibited U.S. ground operations from venturing outside the borders of South Vietnam. Consequently, the communists had safe havens where U.S. troops could not follow them. Moreover, the United States could not target the main suppliers of weaponry for the communists—China and the Soviet Union.

One of the biggest problems faced by the United States was the inability to win over the hearts and minds of the Vietnamese people. The communists could cast the Americans as one more in a long line of foreign aggressors. Moreover, the terrific devastation of the Vietnamese countryside wrought by U.S. bombing was used as a useful propaganda tool by the communists. Combined with the continued weakness of the South Vietnamese government, it became increasingly difficult for the United States to create a viable, independent, and popularly supported South Vietnam. Finally, and perhaps most decisively, the Vietnamese communists were fighting

for their independence, which gave them a tremendous will to win and led them to accept enormous casualties without surrender. Although he would die in 1969 and not see the unification of an independent Vietnam, Ho had prophetically told the French, "You can kill 10 of my men for every 1 I kill of yours, yet even at those odds, you will lose and I will win." That same determination would carry his followers to victory over the United States.

Turning Point

Although the end of the war seemed nowhere in sight as 1968 began, U.S. politicians and strategists assured the public that battlefield victories meant that the war was being won. However, on January 31, 1968, while the Vietnamese were celebrating the Tet festival to usher in the lunar new year, the communists—still under the military leadership of Giap—launched simultaneous attacks on nearly every major town, city, and military base in South Vietnam. Most of the attacks were repulsed fairly easily, but in some areas, such as around the city of Hue and at the marine base at Khe Sanh, the fighting was vicious and protracted. Tet proved to be a military disaster for the communists, with nearly 100,000 casualties suffered. Westmoreland asked Johnson for 260,000 more troops to press home what he saw as a moment of weakness for the communist forces. However, Tet proved to be the key event in turning the fortunes of war firmly against the U.S. and South Vietnamese forces. Having been told for years that victory was at hand, the scale and ferocity of the Tet offensive made many Americans fear that the war could drag on for years with no guarantee of victory. Public opinion in favor of the war was beginning to wane before Tet as the U.S. death toll rose and images of bodies being brought home appeared on television screens nightly; but after Tet—particularly with trusted media figures such as the CBS news anchor Walter Cronkite predicting a stalemate—thoughts turned more toward salvaging national pride than on winning the war. Johnson refused Westmoreland's request for further troops and soon thereafter scaled back the U.S. bombing campaign. In a more dramatic turn of events, Johnson appeared live on American television on March 31, 1968, to announce that he would not seek reelection as the Democratic presidential

candidate so that he could devote his time to Vietnam and other domestic crises engulfing the nation.

Public opinion on the war further soured when revelations of U.S. atrocities against the Vietnamese came to light. The most notorious of these was the My Lai massacre, which occurred in March 1968 (although news of it broke in November 1969). At the village of My Lai, U.S. soldiers killed more than 300 unarmed villagers—mostly women, children, and the elderly—suspected of communist sympathies. Although this was an isolated incident in the overall context of the war, news of this and other atrocities increased questions about the brutality of the conflict and what it was doing to both Vietnamese civilians and the psyche of American soldiers.

The Home Front

From the very outset of the war, many Americans had questioned the nation's role in what seemed to some like the thwarting of a small nation's struggle for independence. But as the war dragged on, the questioning intensified. Beginning in April 1965, a series of protest marches—organized by groups such as the Students for a Democratic Society—descended on Washington, D.C. The biggest of these, in November 1969, drew more than 500,000 protestors as part of a nationwide Moratorium to End the War in Vietnam. Along with the moral objections to the war, many protestors opposed the ongoing draft that fueled the war's manpower needs. Johnson had refused to call up the nation's military reserves and the prospect of being called up to serve in an unpopular war forced many to take to the streets. Other sectors of society leading the protests included members of the counterculture youth movements, who experimented widely with drugs and advocated "making love not war." In the aftermath of Tet, an increasing majority of the American public came to believe that the war was no longer in the nation's interest. The final estrangement for many came with the 1971 publication in the *New York Times* of excerpts from a classified Department of Defense history of U.S. policy in Vietnam. The report, dubbed "The Pentagon Papers," was leaked by Daniel Ellsberg, one of the report's contributors, and it revealed that successive administrations had lied to the public about the steps taken toward

U.S. involvement in the war and in their estimations of the chances for victory. Toward the end of the conflict, a skeptical public was joined by many Vietnam veterans who joined the antiwar movement and offered first-hand testimonies of the brutality of the conflict.

Following the war's end, military strategists and many Vietnam veterans often decried the loss of public support as the main cause of the U.S. defeat. Ultimately, the loss of support on the home front did help convince the nation's politicians that U.S. involvement in the war was no longer feasible. But the public opposition to the war was no knee-jerk pacifist reaction; rather, it represented a broad-based consensus that the escalating casualties, enormous costs, and damaging impact on America's global standing constituted a burden no longer worth bearing.

Nixon and Vietnamization

When Richard Nixon succeeded Johnson as president in 1969, most Americans favored an end to U.S. involvement in the war. Nixon offered a vague promise of ending hostilities and bringing "peace with honor." His approach included increased negotiations with the North Vietnamese (which had begun after Johnson had suspended the bombing of North Vietnam following Tet), with National Security Advisor Henry Kissinger acting as the lead negotiator. As part of his wider policy of détente, Nixon also encouraged China and the Soviet Union to push North Vietnam toward a negotiated settlement. The second part of Nixon's plan was called "Vietnamization." This program involved turning over the burden of prosecuting the war to the South Vietnamese, while drawing down U.S. troop numbers. The ARVN would continue to get U.S. weapons and supplies, allowing it to theoretically maintain the security of South Vietnam. Nixon began the withdrawal of U.S. soldiers—25,000 in June 1969 and 150,000 in April 1970—clearly indicating that America was abandoning its crusade. This was a slow and painful drawdown, however, as more than 21,000 of America's combat deaths occurred after his election.

By the beginning of 1972, a little more than 140,000 U.S. soldiers remained in South Vietnam. Those who did remain tended to suffer from low morale and occasional lax discipline as the sentiment that "I don't want to be the last one to die

in Vietnam” became common among the soldiers. Even worse, in the closing years of America’s involvement in Vietnam, there witnessed growing incidents of enlisted men “fragging” their officers. The term “fragging” was the vernacular expression given to violent—often fatal—attacks against superior officers by some soldiers in Vietnam. The term referred to the use of fragmentation grenades sometimes used in such attacks. Although incidents of fragging had occurred in almost every conflict before and perhaps since Vietnam, the practice gained particular notoriety as America’s war effort began to draw down, particularly after 1970. Some press reporters and politicians highlighted the practice as being symptomatic of the decline in military discipline and morale. Studies of the motives behind fragging reveal that most incidents occurred in rear areas and not in the heat of battle. Contributing factors often included drug and alcohol usage by the perpetrators. In addition, programs such as Project 100,000, the Department of Defense initiative to admit soldiers who might previously have been rejected on physical or psychological grounds, also resulted in recruits who might not have been prepared for the discipline required of soldiering in Vietnam. Other attacks were racially motivated as some drafted minorities adopted the more radical antiwar doctrines of the Black Nationalism movement. While the incidents tended to stem from individual grievances against particular officers, the victims were often NCOs who were either too eager to lead their soldiers into the jaws of battle or who lacked the combat experience to be effective leaders. As the war wound down, the military became increasingly wary of such incidents and moved to restrict access to fragmentation grenades and individual weapons.

The final stage of Nixon’s plan actually included widening the war. In an effort to secure better peace terms from the communists by negotiating from a position of strength, Nixon targeted enemy sanctuaries in Cambodia. This attack was part of a new tactical direction for the Military Assistance Command Vietnam, introduced in 1969 under the new commander, Creighton Abrams, to take the fight more directly to areas of North Vietnamese army strength. News of the U.S. soldiers’ invasion of Cambodia led to some of the most violent antiwar protests of the Vietnam era. In May 1970, Ohio National Guardsmen at Kent State University opened fire on protesting students, killing four.

In April 1972, Nixon also restarted the bombing of North Vietnam, with massive air strikes—code-named Linebacker—in response to an attempted invasion of the South by North Vietnamese forces.

Endgame

Peace talks continued throughout 1972, with both sides seemingly keen on an agreement. But when talks stalled at the end of the year, Nixon increased the bombing of North Vietnam by launching Linebacker II, or “the Christmas Bombings.” The massive destruction wrought by these raids brought both sides back to the negotiating table in January 1973; by the end of the month, an agreement was in place. The provisions of the Paris Peace Agreement—signed on January 27, 1973, by Kissinger and his North Vietnamese counterpart, Le Duc Tho—included (a) an immediate cease-fire, (b) the withdrawal of all remaining U.S. forces, (c) reunification elections, (d) the recognition of South Vietnam by North Vietnam, and (e) the return of all U.S. prisoners of war. The agreement marked the end of significant U.S. involvement in South Vietnam. Although Nixon publicly lauded the final accords, they contained no enforcement mechanisms; without direct U.S. support, South Vietnam remained incredibly vulnerable to invasion from the North. Realizing this, the South Vietnamese president, Nguyen Van Thieu, refused to sign the agreement. With U.S. aid drying up, South Vietnam began to crumble. The corruption and military ineffectiveness that had characterized the nation since its inception had hardly abated. When North Vietnam launched its almost inevitable attack in 1975, the South Vietnamese proved wholly incapable of putting up sustained resistance. By April, communist tanks were in Saigon, forcing a desperate evacuation of the remaining U.S. personnel. The images of crowded helicopters fleeing from the U.S. embassy provided an appropriately ignominious end to America’s involvement in Vietnam. Public reaction in the United States was muted, and Congress refused President Gerald R. Ford’s attempts to provide any meaningful aid to the South.

Aftermath and Consequences

With North Vietnam forcibly reunifying the nation, America’s goals of creating a viable democracy in South Vietnam and preventing the spread of

communism had failed, thereby inflicting America's first military defeat in what was—at the time—its longest ever war. The war had proved to be terrifically destructive. In addition to the 58,000 U.S. deaths, the South Vietnamese lost an estimated 250,000 persons. Communist forces suffered more than 1 million killed, while estimated civilian casualties were as many as 2 million. Economically and environmentally, Vietnam was devastated and took years to recover. While a majority of America's Vietnam veterans returned to civilian life with little trouble, a significant minority suffered from the psychological trauma of fighting in a war that few of their countrymen appreciated. The dedication of the Vietnam Veterans Memorial in Washington, D.C., in 1982 offered some solace for their suffering, but the scars ran deep. The United States was culturally and politically shaken as the prosecution of the war raised questions about the trustworthiness of the government and the moral righteousness of America's military and Cold War mission. Consequently, the United States suffered a loss of international prestige during the 1970s in the wake of the defeat. Furthermore, the president's war-making powers were significantly circumscribed by the 1973 War Powers Resolution, and for a generation (at least up through the 1991 Persian Gulf War), the nation's ability to engage in military conflicts was hamstrung by a paralyzing fear of large-scale open-ended military engagements with unclear goals—a condition generally referred to as “the Vietnam syndrome.”

Historical Interpretations

The Vietnam War raised many questions about the nature of U.S. foreign policy and, perhaps more broadly, the American character. Unsurprisingly, therefore, historians have engaged in a lively and often polemic debate over the war's meaning. One of the biggest points of contention was—and remains—the question of why the United States got involved in the war—that is, was this the wrong war at the wrong time at the wrong place, or was the conflict a necessary part of the nation's global commitment toward containing communism? Perhaps the most pervasive view among scholars remains that the war might have been undertaken with good intentions by U.S. policymakers, but they erred in their calculation on several fronts, such as overstating the geopolitical importance of South Vietnam,

backing a corrupt regime under Diem, failing to appreciate the nature and ferocity of Vietnamese nationalism, and failing to develop a coherent and effective strategy to win the war from the outset. This combination of factors combined to create a situation from which the United States was never likely to emerge victorious. Such views have tended to permeate many of the most popular syntheses on the war, such as David Halberstam's *The Best and the Brightest* (1972), Frances FitzGerald's *Fire in the Lake: The Vietnamese and the Americans in Vietnam* (1972), Stanley Karnow's *Vietnam: A History* (1983), George Herring's *America's Longest War: The United States in Vietnam, 1950–1975* (1986), and George Donelson Moss's *Vietnam: An American Ordeal* (1990). One of the main architects of the war, McNamara, confirmed many of the tenets of this orthodox view in his memoir *In Retrospect: The Tragedy and Lessons of Vietnam* (1995).

During the 1980s, some scholars began to question the notion that the war had been a tragic mistake. Reflecting the conservative milieu of the 1980s and Ronald Reagan's notion that the Vietnam War had been a “noble cause,” revisionist scholars tended to accept that the war was a just cause given the need for anticommunist vigilance during the 1960s. Accepting the need for U.S. military intervention in Vietnam, these scholars then focused their attention on the reasons for the military defeat. Probably the most influential of the revisionist texts was Harry G. Summers Jr.'s *On Strategy: A Critical Analysis of the Vietnam War* (1982). Summers—an army colonel during the war—criticized civilian leaders for failing to fully mobilize the public behind the war effort and military leaders for focusing too much attention on the Viet Cong while ignoring the locus of communist power in North Vietnam. For Summers, greater attention to the counterinsurgency in the South, instead of the destructive war of attrition, combined with a more conventional assault on the North and on communist sanctuaries in Laos and Cambodia, could have produced a victory for the United States. More recently, several scholars have continued to argue that the war was a worthy crusade and that the United States could have won the conflict with different tactics. Michael Lind, in *Vietnam, the Necessary War: A Reinterpretation of America's Most Disastrous Military Conflict* (1999), argues that a failure to stand fast in Vietnam would

have hampered U.S. ability to wage an ultimately successful Cold War battle against what he sees as the dark tyrannical forces of communism. Lewis Sorley's *A Better War: The Unexamined Victories and Final Tragedy of America's Last Years in Vietnam* (1999) suggests that the switch to pacification and Vietnamization programs under Creighton Abrams was yielding positive results by 1971. By then, however, Nixon and Kissinger were more concerned with seeking a way out of the conflict and had lost any remaining hope of achieving a meaningful victory.

In seeking to explain the defeat, some conservative scholars have also blamed the media for the nightly beaming of negative images of the war effort into people's living rooms. The notion that the media turned the public against the war has gained considerable traction in conservative lore far beyond academic studies. Many military leaders also developed a distrust of press reporting during combat, leading to far greater restrictions on journalists' freedoms in conflicts such as the 1991 Persian Gulf War. Qualitative studies of press reporting suggest that the media reporting of the war was not biased and what the military considered negative reporting generally revealed the realities of the nation's plight. William Hammond's *Reporting Vietnam: Media and Military at War* (1998) reveals that most of the media coverage tended to reflect rather than drive the growing public concerns about the war.

Away from the broader political questions, the military experience of the average soldier has garnered a lot of attention. In the 1970s, as the nation struggled to find a meaning to the Vietnam experience, many veterans and journalists wrote insightful accounts of their time in Vietnam. Books such as Tim O'Brien's *If I Die in a Combat Zone* (1973), Michael Herr's *Dispatches* (1977), and Philip Caputo's *A Rumor of War* (1977) have provided some of the most powerful meditations on war ever written. Often, these accounts detailed the day-to-day brutality and drudgery of war. More recently, historical accounts of combat in Vietnam—such as Joseph Galloway and Hal Moore's *We Were Soldiers Once . . . and Young* (1992) and Andrew Wiest's *The Boys of '67: Charlie Company's War in Vietnam* (2012)—have alluded to the camaraderie, heroism, and sacrifices of the soldiers involved. Some historians have, however, questioned the fairness of the draft in selecting those who did serve. Most notably, Christian Appy,

in *Working Class War: American Combat Soldiers and Vietnam* (1993), claimed that the vast majority of those drafted tended to come from disadvantaged families. According to Appy, more privileged citizens could attain college deferments or other avenues to avoid the draft, leaving the burden of military service to fall more heavily on the shoulders of the impoverished or less educated. As with most of the historical issues surrounding the Vietnam War, the questions raised by Appy and others continue to have contemporary relevance. Consequently, scholarly and public interest in the Vietnam War is likely to remain high in the foreseeable future.

VIRGINIA MILITARY INSTITUTE

Virginia Military Institute (VMI), in Lexington, Virginia, is the oldest state-supported military college in the United States. It was founded on November 11, 1839, on the site of Lexington state arsenal, when the first corps of cadets relieved the personnel on duty at the facility. This entry will provide a brief overview of the institution's history and its contribution to the education and development of important U.S. leaders, both political and military. In addition, it will highlight some of the significant changes that have occurred in the institution over the course of the past 20 years.

Early History

In the years between its founding and the outbreak of the American Civil War, Virginia Military Institute quickly achieved a reputation as a first-rate learning institution. The first class, composed of 16 cadets, graduated in 1842. Probably the most famous instructor to teach at the school during its early years was Thomas "Stonewall" Jackson, who began his tenure at the institution in 1851, as professor of natural and experimental philosophy. Cadets from VMI were present at the execution of John Brown in 1859.

Civil War

During the Civil War, the cadets at the institute made important contributions to the Confederate war effort from the outset. Primarily, they assisted in the training of Confederate armies. A number were dispatched under Jackson to aid in the training of new recruits at Camp Lee outside Richmond.

The cadets themselves were called into action on 14 different occasions. The most significant call-up of the corps of cadets at the institute involved their participation in the Battle of New Market on May 15, 1864. In this engagement, the cadets took part in the fighting as an independent unit. The cadets who served that day ranged in age from 14 to 22, with some reports alleging that boys as young as 12 took part in the fighting. In the Battle of New Market, the corps of cadets suffered 52 casualties but did succeed in turning the tide of the battle in favor of the Confederate forces. As a result of their participation in the battle, Virginia Military Institute is the

only military college or academy whose troops hold the distinction of serving as an actual combat unit.

In 1864, Union Army troops under the command of General David Hunter shelled and burned much of the institute's campus as part of the Valley Campaign. The destruction was nearly complete. For a time, classes were held at the Alms House in Richmond. The corps of cadets was actually disbanded as Richmond was evacuated in April 1865 due to the fall of Petersburg. The Lexington campus reopened in October 1865 and has remained in operation ever since.

World War II

VMI alumni made significant contributions to the Allied war effort during World War II. The most notable of those who played a role in the war was George C. Marshall, the top U.S. general during the war. He went on to serve as secretary of state and remains the only military leader to win the Nobel Peace Prize.

In addition, the institute participated in the War Department's Army Specialized Training Program between 1943 and 1946. This program provided training in engineering and other war-related fields to enlisted men at numerous colleges across the country. During the period listed above, the institute served more than 2,100 enlisted men in the Army Specialized Training Program.

Code of Honor

VMI is known for its strict code of honor, which has remained unchanged since the facility's founding. Under the code, students do not lie, cheat, or steal, nor do they tolerate anyone who does. Violation of the code itself as well as protection of violators through failure to come forward both are offenses punishable by dismissal from the institution.

Corps of Cadets

Currently, VMI houses 1,300 cadets from 37 states and nine foreign countries. To enter the institute, prospective cadets must be between the ages of 16 and 22, be unmarried, and meet the physical requirements for membership in the Reserve Officers' Training Corps. In addition, they must be graduates of an accredited secondary school or demonstrate completion of an approved home-schooling

curriculum. The composition of the student body has changed over the years to reflect the changes in American society. For instance, the institute accepted the first African American cadets in 1968. In addition, after a long legal battle, the first coed class, which included 30 female cadets, was introduced in the institute in 1997. They matriculated in the class of 2001. Tradition is a hallmark of student life at VMI. The uniforms worn by the students are of the same design as those issued to the first class of cadets in 1839. In addition, the members of the upper classes subject the incoming first-year cadets, colloquially known as “rats,” to additional close inspection and heightened discipline. The various rituals that form a part of life at the institution aid in the inculcation of the esprit de corps in each successive class.

Conclusion

Since its inception in 1839, the Virginia Military Institute has strived to achieve and maintain a high level of academic excellence in its cadets. The alumni of the academy have demonstrated the success of the institution in attaining this goal repeatedly over the years. As the institute has moved into the 20th century, it has changed to meet the new demands of the society it serves, at some times more willingly than at

others, but it has not sacrificed the core principles that contributed so much to the success of its graduates.

W

WAR, PRINCIPLES OF

There are nine commonly recognized principles of war in military doctrine: objective, offensive operations, mass, economy of force, maneuver, unity of command, security, surprise, and simplicity. Recognizing the experience of joint operations in the Iraq and Afghanistan wars, recent Joint Service doctrine adds restraint, perseverance, and legitimacy to the historical set of nine. Planners and commanders use the principles of war conceptually rather than as a formal checklist. The principles of war are a distillation of centuries of military thought on the common elements of successful military operations. Incorporating the principles of war in a war plan does not guarantee success, but historical examples suggest that such plans do have a higher likelihood of success. Military planners use the principles of war conceptually to study past campaigns. As an analytical tool used in military education, the principles of war highlight common elements of successful military operations at the tactical, operational, and strategic levels of war.

Development of the Principles of War

One of the earliest military thinkers who attempted to identify and define common characteristics of warfare was Sun Tzu. While Sun Tzu's *The Art of War* does not proffer specific elements that should be part of military operations, it does provide an intellectual framework for general concepts of common

operations. Ancient Greek writers also sought to capture principles of warfare in their works by identifying common characteristics of successful battles. Two of the most popular military thinkers of the 19th century, Carl von Clausewitz and Baron Antoine de Jomini, built on those earlier examples to explain the success of Napoleon Bonaparte in his continental campaigns.

In the 20th century, the French marshal Ferdinand Foch was the first military thinker to produce principles of war recognizable in U.S. military doctrine today. He based his concepts on study of the successful Prussian campaigns of the late 19th century, and Foch's work became the basis for training French officers up to World War I. British General J. F. C. Fuller developed the original principles of war borrowed by the United States after reflecting on the experience of World War I.

U.S. military doctrine formally defined the principles of war after its experience in World War I as movement, economy of force, surprise, objective, mass, offensive operations, cooperation, security, and simplicity. During the interwar years, military officials questioned the use of these principles because of the introduction of armor and aircraft technologies. World War II, however, proved that the adaptation of tactics to utilize these new technologies did not invalidate the principles. In doctrinal updates following the war, cooperation changed to unity of command and movement to maneuver. The counterinsurgency experience of the Vietnam War seemed to invalidate the principles of war, but Cold War doctrinal updates reaffirmed the use

of the principles of war in the 1980s. Today, all branches of the U.S. armed forces incorporate the nine principles of war into their respective operational doctrine manuals.

The Principles of War Defined

A military objective is the end goal of a warring party and must be clearly defined, attainable, and produce decisive results. The *objective* is the focal point that all subsequent planning is based on. Commanders must understand the implications of achieving, or failing to achieve, the military objective. Political implications must be considered at the strategic level of war since military means achieve political ends. While always important, this aspect has greater meaning in stability and support operations because of the proliferation of communication capabilities around the world and closer interaction of military forces and civilians. The ability to broadcast an event around the world nearly instantaneously has greatly expanded the power to shape perceptions of that event. Commanders, therefore, must clearly understand and communicate objectives to subordinates to maintain positive relationships with host nation civilians and facilitate political relationships.

The principle of *offensive operations* is the key to all decisive military campaigns. Units pass to the defense to consolidate and reorganize or to protect infrastructure and population centers among other reasons. Defense is a temporary position and is usually a small part of a larger offensive plan. Offensive operations seize initiative and confuse or disorient the enemy. Maintaining initiative forces the enemy commander to make decisions that create opportunities for friendly forces to exploit. This principle resulted in large part from the experience of trench warfare in World War I. The use of the machine gun contributed to stalemated lines in western Europe. The cost in human lives was high and the combatants struggled to develop new technologies and tactics to break through. Among these was the first generation of tanks. World War I proved so ghastly in its human costs that after the war most military thinkers agreed that maintaining offensive operations was the best way to conclude a war quickly, thereby reducing the number of deaths and human suffering.

The principle of *mass* suggests that commanders should bring the most combat power available to

them to bear on the enemy at a decisive point on the battlefield. This principle remains the same despite changes in the technology of warfare. During the American Civil War, this principle included the use of infantry, horse-mounted cavalry, and artillery to achieve an objective. In World War II, commanders brought together infantry, armor, long-range artillery, and bomber aircraft. The Korean and Vietnam wars included the use of helicopters, while the recent wars in Iraq and Afghanistan showcased the use of artillery fired from aircraft. In all of these examples, the technology has improved while the concept remained the same. Commanders bring together all available assets to overpower an enemy, and massing combat power achieves the best result when applied to the decisive point on the battlefield. A commander determines where the decisive point is during his planning process by deciding where success will lead to achieving the stated objective.

On the opposite end of mass is the principle of *economy of force*. A commander economizes force by devoting only the minimal combat power needed to achieve secondary objectives. This, in turn, leaves the maximum amount of combat power available to mass on the primary objective. Operations always have constraints against available combat power as a result of the distribution of forces as orders pass successively from higher command levels to lower. Commanders wisely choose where and when to commit smaller forces to secondary objectives by communicating a clear objective and vision for accomplishing the mission. A commander using a feint to draw away enemy forces from his or her primary objective is an example of economizing force. In this example, the feint would be composed of only enough combat power to make the enemy commander believe it was the decisive force. Once the enemy commander commits his forces to the feint, the friendly decisive force is able to mass its combat power on the objective.

The principle of *maneuver* encompasses how a commander moves and employs all available combat power during an operation. At the tactical level, maneuver includes the positioning of small units on the battlefield. Blocking positions, checkpoints, withdrawals, and raids are examples of small unit maneuvers among others. The concept remains the same at the operational level while the units and the geographical areas are larger. Strategically, maneuver includes all branches of the Department

of Defense, U.S. and overseas basing, and even manpower and equipment structures. The recent restructuring of the army to provide modular brigades and the rebasing of units from Germany to the United States are examples of strategic-level maneuvers. Operationally and tactically, the principle of maneuver includes how a commander positions assets in both space and time to achieve an objective.

The most effective way to maintain command and control of a military operation is to have one unified commander. This is the principle of *unity of command*. Operations with multiple commanders lack synchronization and unity of effort, resulting in wasted organizational energy and failure to achieve the objective. No unifying structure to keep all subordinate units working toward the same goal results in operational drift. The challenge of maintaining unity of command has increased with the modularization of military forces and further integration of military and other governmental agencies in theaters of operation. Multiagency operations, such as Operation New Dawn in Iraq, show the difficulty of maintaining unity of effort. A brigade commander is likely to have members of the State Department on staff, yet those staff members report simultaneously to the brigade commander as well as their own superior within the State Department. The U.S. Army experienced problems with this in Somalia in 1993, as many nongovernmental organizations sought to provide aid to the local population but had no coordination with military units operating in the same geographical area. Unity of command is essential to the other principles of war. Without a single responsible commander, it is difficult to achieve the others.

The principles of *security* and *surprise* are reciprocal. The goal of security is protecting friendly combat power, while achieving surprise facilitates the destruction of a confused enemy. Commanders use a variety of techniques to maintain security and prevent the enemy from surprising friendly forces. The enemy commander may send reconnaissance patrols, or may employ more passive measures such as video records, to answer questions that facilitate his attack plans. This is true in high-intensity conflict as well as stability and support operations. The enemy has employed goat herders and farmers in the Iraq and Afghanistan wars to collect intelligence on U.S. forces. The use of video recorders has aided the enemy in the placement of improvised explosive devices along convoy routes

to achieve surprise. Conversely, friendly commanders employ the same measures to provide security for their forces. Counterreconnaissance patrols and unmanned drones identify enemy attempts at intelligence gathering and prevent the enemy from achieving surprise. Deception is another method of maintaining security. Commanders use feints to keep the enemy off-balance and prevent him from discovering the true objective of the operation until it is too late. Successful security measures allow a commander to mass combat power on his objective.

The principle of *simplicity* suggests that the best plans are those that are direct and easy to understand. These two characteristics reduce the potential for confusion and facilitate the flow of an operation. Simplicity is tremendously important in multinational, coalition, and joint operations as well as those involving other government agencies. In multinational and coalition operations, cultural and language differences can lead to misunderstandings that reduce the ability of the unified commander to mass combat power on the objective, maintain security, and effectively maneuver forces. Joint operations, or those involving more than one branch of the armed forces, must be kept simple because of doctrinal and equipment differences. Other government agencies operate under different rules from any branch of the armed forces, and most are unfamiliar with military operational terms and graphics. Simple plans help smooth over these differences and keep all elements working toward the same goal.

Joint doctrine adds three additional principles: *restraint*, *perseverance*, and *legitimacy*. The principle of restraint suggests that the avoidance of unnecessary collateral damage and excessive force helps maintain the support of the populace for military presence and operations. Restraint makes a direct link between the strategic and tactical levels of war by pointing out the potential political, and therefore strategic, problems that result from the excessive use of force. Excessive force in some areas of Iraq following the toppling of Saddam Hussein's regime contributed to the rise of the insurgency in late 2003. Unnecessarily detained or threatened Iraqis saw little difference between Hussein's regime and U.S. forces. Many came to view the insurgency as a fight for freedom against an occupation force. The infamous events at Abu Ghraib also demonstrated the effects of a lack of restraint by U.S. forces. Restraint is a principle that commanders train into their forces.

The rules of engagement and engagement criteria are operational control measures that help maintain restraint.

Perseverance refers to the commitment necessary to achieve national objectives. This principle is useful primarily at the strategic level since units at the operational and tactical levels have no input into how long an operation will last, except their reports and assessments that feed into that decision. Joint doctrine advises that economic and diplomatic measures in conjunction with military operations are sometimes necessary to achieve national goals. These additional measures may be required to address the underlying causes of a conflict and take time to fully implement.

Finally, joint doctrine adds the principle of legitimacy. Legitimacy has two components: (1) the legitimacy of joint forces and (2) the legitimacy of host nation governance. The legitimacy of joint forces supports perseverance. When the legitimacy of an operation is in question, the perseverance required to attain national objectives may not materialize. Conversely, when an operation is legitimate, the will to persevere is more likely to be present. An operation's morality and legality undergird its legitimacy, and the will and support of both the U.S. public and the civilian population within the area of operation maintains its legitimacy.

The second part of legitimacy is the maintenance of the legitimacy of host nation governance. If U.S. forces conduct all operations on behalf of the host nation government, then the public may call the legitimacy of that government into question. Restraint exercised by U.S. and host nation forces reinforces legitimacy. Public services provide another avenue to maintaining legitimacy. When a host nation government is able to provide security, water, education, and other standard services, its population is more inclined to accept governmental authority. Insurgent forces that are able to provide basic services to local populations erode the legitimacy of the host nation government. U.S. forces must bolster host nation legitimacy in ways that do not compromise security but also do not accidentally delegitimize host nation forces by doing too much.

The Future of the Principles of War

During the Vietnam War, U.S. doctrine writers called the usefulness of the principles of war into question. The principles seemed more applicable to the

high-intensity conflicts of the World Wars and the first year of the Korean War than to the counterinsurgency of Vietnam. U.S. planners revived the principles when they focused on a potential World War III against the Soviet Union. Many believed the stunning success of coalition forces in the 1991 Persian Gulf War validated the principles of war. Nevertheless, the recent wars in Iraq and Afghanistan and the resulting addition of three principles to joint doctrine show that as war evolves, so too will the principles of war.

Recent military thinkers have suggested the need to create national principles of war and rename the traditional principles of war as "the principles of military operations" to better synchronize military means with political ends. The development of national principles of war would provide a guideline for elements of national power other than the military, and these principles would parallel the familiar military principles of war. Pointing to a lack of strategic coherence as the traditional American way of war, proponents of the national principles of war argue that the difficulty in achieving the described national aims of the Iraq and Afghanistan wars proves the need to synchronize economic, diplomatic, and information assets with military operations. In this way, all assets of national power can be cohesively leveraged to accomplish national goals rather than relying on military power alone.

Cyber and information warfare has presented another challenge to the principles of war. The past decade has witnessed the inclusion of these two types of conflict in military doctrine to recognize the technologies and complexities of the current operating environment. While some military thinkers argue that the principles of war pertain to actual conflict between armed forces, others argue that cyber and information warfare is integrated into ground combat rather than conducted separately and, therefore, is already contained within the principles of war. Proponents of applying the traditional principles of war to cyber and information operations argue that these capabilities are merely new tools for commanders to achieve the same effects as the traditional tools of warfare. Joint doctrine already describes this realm as being equivalent to, rather than separate from, the realms of land, sea, and air. Therefore, there is no need to expand the traditional principles of war.

The conflicts of the 20th and 21st centuries have demonstrated the durability of the traditional nine

principles of war found in U.S. military doctrine. It seems that debate over the usefulness and applicability of the principles of war is over. Yet debate over the modification of the principles of war, if they should change at all, will likely continue as the parallel debate over what future threats will look like occurs. This remains primarily an intellectual debate as military planners do not use the principles of war as an operational checklist. They serve as an intellectual basis for planners to conceive of operations to meet stated goals. The principles facilitate the study of past wars to help planners better understand how and why some operations succeeded while others failed. Debate over the principles of war is a healthy exercise as it demonstrates the continued striving of military professionals to perfect their craft and achieve the goals of the nation that they serve.

WAR DEAD, DISPOSITION OF

Since the American Civil War, the disposition of the war dead has been a matter of considerable importance to Americans in and out of uniform, with military authorities taking great care to recover, identify, and inter the fallen, as Americans more generally

have made them central to their conversations about war. As preeminent symbols of the risks and rewards of military service and national belonging, the war dead have been used to glorify and condemn war, to soothe and enflame wartime antagonisms, and to expand and restrict routes to full American citizenship. They have lent themselves to powerful revisions of the nation's principles, as in the Gettysburg Address, and inspired its most visited national shrines, such as the Tomb of the Unknown Soldier and the Vietnam Veterans Memorial. They have also sparked controversy, as when the Department of Defense banned news coverage of remains repatriation from the outbreak of the Persian Gulf War in 1991 until that policy was reversed in 2009. This entry examines the origins, evolution, and purpose of the U.S. military's efforts to recover the war dead in order to better understand recent controversies over the representation of the fallen.

Origins and Evolution

The outlines for today's casualty resolution practices emerged during the Civil War. Before then, authorities took little interest in the war dead, restricting their efforts to repatriating the remains of officers while making minimal accommodations for those who wished to honor less exalted warriors. But with the staggering death tolls of the Civil War, federal officials adopted a more democratic approach toward the final disposition of the dead, with Congress creating the national cemetery system in 1862, while the War Department ordered commanders to inter their dead in individually marked graves therein. These mortuary practices soon became central to popular understandings of the conflict and public support for it, as reflected in President Abraham Lincoln's Gettysburg Address, which made the orderly rows of the Union dead sacred symbols of the new democratic and racial order that the war promised.

Because they were so important to emerging visions of the nation, the war dead remained important to combatants on both sides of the conflict long after the Civil War ended. Federal forces labored to recover and rebury more than 300,000 Union dead in the years after the war, identifying a little more than half that number. Unprecedented both in scale and character, this effort endeavored to find, identify, and inter every Union corpse, regardless of rank, at public expense. Yet even this historic

undertaking left vast numbers of federal dead missing or unidentified, and it neglected entirely the 258,000 Confederate dead. Initially excluded from national cemeteries, Confederate remains did not win the right to federal custodianship until 1898, when the Spanish-American War brought sectional reconciliation in a wave of resurgent nationalism.

The Civil War's memorial innovations were further refined in the 20th century, when total war required new levels of public mobilization and posed new threats of wartime oblivion. Like other combatant nations, the United States undertook a massive effort to locate and rebury the dead during and after the First World War, recovering all but 3,000 of the 80,000 Americans killed in Europe. Under a policy of voluntary repatriation, some 70% of the fallen were returned to the United States for burial. The remainder were interred in overseas cemeteries constructed throughout western Europe. To stand in for those who would never be found or, if found,

never identified, an unidentified American warrior was returned to Arlington National Cemetery and buried at the Tomb of the Unknown Soldier. This tradition was repeated after the Second World War, which left far more Americans missing and unidentified, some 87,000 total. While mortuary affairs advanced during and after the war, allowing for the positive identification of 97% of all recovered casualties, far-flung military operations left huge numbers permanently lost, especially in the Pacific. Thus, while most families elected to have their loved ones repatriated to the United States at the war's end, more than 20% never had such an option. The same could be said of the Korean War, where nearly 8,200 Americans were left missing after the fighting ended, more than 22% of all American deaths in the conflict. Indeed, so many American bodies were lost behind enemy lines in the war's early fighting that graves registration units discontinued the practice of burying the war dead in theater in late 1950.

Instead, they instituted a policy of concurrent return, whereby the dead were shipped to Japan for identification before being returned to the United States for burial while combat continued, a practice that continues to this day.

From that point on, Americans came to expect that the war dead would be returned to the United States while fighting continued, and they grew increasingly intolerant of situations where that proved impossible. By and large, the U.S. military proved capable of satisfying public expectations. As American warfare grew more asymmetric in Vietnam and after, and as the military grew more proficient in speeding the dead and wounded from the front to the rear, the number of missing dropped precipitously. In Vietnam, just 2,500 Americans remained missing at

war's end, fewer than 5% of those killed. But because those "missing in actions" became a source of significant controversy in the 1970s and 1980s, prompting allegations that the U.S. government was not doing all it could to recover missing warriors, civilian and military officials grew increasingly sensitive to the costs of mishandling the war dead. This sensitivity prompted a new emphasis on force protection, which some critics derided as "casualty aversion," and a new determination to control access to images and information about American casualties.

Recent Policy and Political Controversies

The U.S. government has regularly restricted access to images of American casualties during wartime,

The remains of Air Force Captain Jefferson S. Dotson are carried to his final resting place by members of the Army's Old Guard Caisson Platoon during a Full Honors Funeral Repatriation at Arlington National Cemetery, Virginia, October 25, 2002. Dotson, an F-100F Super Sabre pilot, was declared missing in action more than 30 years ago when his fighter-bomber went down during a Forward Air Control reconnaissance mission over the Ho Chi Min trail in central Laos. Dotson's remains were discovered in spring 2002 near his jet's crash site and were positively identified through DNA testing.

censoring photos of the war dead throughout most of World War II, for instance. Still, from the Civil War through the Cold War's end, it was common for Americans to see graphic images of the dead and less disturbing images of flag-draped coffins. Even in World War II, officials eventually authorized the publication of photos of the dead to motivate Americans to see the war through to its end when most were looking ahead to the resumption of peace. Rather than undermine support for the war, authorities assumed that images of dead Americans would rekindle anger at the enemy, calculations that proved correct and persisted through the Vietnam War. But when war in Vietnam proved unpopular, many observers began to rethink this view, and by the late 1980s, it had become conventional wisdom that bloody imagery of American casualties in Vietnam had eroded support for the war, with some even claiming that critical press coverage had caused an otherwise avoidable American defeat.

Such thinking, which was particularly attractive to those intent on reasserting the utility of force in the post-Vietnam War era, informed the first Bush administration's decision to prohibit press coverage of remains arrivals at Dover Air Force Base on the eve of the 1991 Persian Gulf War and to otherwise restrict public access to politically sensitive information. Secretary of Defense Dick Cheney, a longtime critic of the news media and staunch advocate for government secrecy since his days in the administration of Gerald R. Ford at the end of the Vietnam War, was the lead architect of the policy. And though his restrictions on reporters prompted an outcry from the press, the war was so short lived and relatively cost-free in American lives that controversy soon subsided, and the ban on images of caskets returning to Dover formally remained in place.

But despite the ban on news coverage of Dover repatriation ceremonies, images of flag-draped coffins were common in the Clinton years and early in the second Bush administration. In 1998, photos of returning caskets of Americans killed in the bombing of the U.S. embassy in Nairobi, Kenya, were disseminated, for instance, as were images of caskets returning from the terrorist attack on the USS *Cole* in 2000. And the coffins of Americans killed in Afghanistan were often photographed en route to Dover. Throughout this period, policymakers spoke of "the Dover test" when contemplating military

action, suggesting both the public's continued access to images of the war dead and continued official unease over that access. Thus as the Bush administration prepared to invade Iraq, it revisited the issue, imposing a worldwide prohibition on media coverage of all deceased U.S. military personnel. Pentagon officials cited the privacy of military families as their sole consideration, but critics saw this step as the latest in a series of moves by administration insiders like Vice President Dick Cheney that were intended to conceal the war's true costs from public view.

As the Iraqi insurgency intensified in late 2003 and American casualties grew apace, such criticisms mounted, with news outlets printing photos from Dover after an air force agency mistakenly granted a Freedom of Information Act request in 2004, while ABC's *Nightline* devoted a program to reading the names of Americans killed in Iraq as it aired portraits of each. In June 2004, Senator Frank Lautenberg, a New Jersey Democrat, sought to amend a defense spending bill to allow journalists to report from Dover, though the measure was rejected by the Republican majority. If Republican lawmakers had convinced each other of the merits of the ban, though, they failed to persuade the public, with 62% of Americans telling pollsters that coverage of returning remains should be allowed. And the war dead appeared frequently in cinematic treatments of the war in both reverential and critical forms. In the face of continued opposition, the Pentagon softened the ban in 2005 by agreeing to release official Department of Defense photos from Dover to the press, a compromise that remained in place through the 2008 election.

Soon after President Barack Obama took office in 2009, Secretary of Defense Robert Gates announced that news media would be allowed to attend remains repatriation ceremonies at Dover and photograph the coffins of the war dead so long as the families of the dead consented. Though some families protested the change, in the 6 months after the ban was lifted, 60% of families asked for reporters to attend the remains repatriation ceremony, suggesting that their views on the ban were in line with those of the general public. But after the novelty of such coverage wore off, it became clear that few reporters or ordinary Americans wished to witness the repatriation of remains on a regular basis. At many arrivals, the Associated Press and military camera crews are the

only media present. And so the Defense Department that once prohibited images of the fallen has more recently become the leading distributor of such images.

If this outcome is ironic, it is not historically surprising. Throughout American history, military authorities, military veterans, and military families have been among the leading proponents and primary instruments for recovering, reburying, and celebrating the war dead. Through honoring the sacrifices of the dead, those parties did more to encourage respect for the military and to foster support for war than they did to dampen enthusiasm for either. The notion that the sight of the American dead alone diminished public support for war or the military reflected a misreading of the Vietnam War that reduced that conflict's manifold problems to a single media scapegoat. On the other hand, respect for the fallen cannot sustain support for war in the absence of other compelling rationales or evidence of progress, and awareness of war's costs can and should serve to dissuade societies from entering it lightly or waging it indefinitely. Sending this message has been one reason that military institutions, soldiers, veterans, and military families have traditionally endeavored to recover and commemorate the war dead.

WAR FILMS

New York Times columnist Russell Baker once sardonically stated that President Ronald Reagan “had trouble distinguishing history from old movie plots.” If so, Mr. Reagan was no different from millions of other people who have come to see films as a reflection of historical reality. Motion pictures can both shape and reflect our understanding of the past in general and of military history in particular. That influence is pervasive and complex. Indeed, the first war film—*Tearing Down the Spanish Flag* (1898)—appeared at the dawn of the age of moviemaking and had great public appeal. It reflected the general enthusiasm for the war and stimulated widespread interest in motion pictures as mass entertainment. War films have retained their fascination for filmmakers and audiences into the 21st century. However, the nature of war films has radically changed; simple appeals to patriotism or the endorsement of national ideals and martial objectives evident in that first film on the eve of the 20th century and brought to perfection during the Second World War no longer elicit patriotism. The old appeals to victory and honor have been replaced almost entirely in the 21st century by a pervasive anti-war spirit emphasizing the futility of war and its baleful consequences for soldiers and civilians. The slaughter of two World Wars and the legacy of the Vietnam syndrome (defeat and humiliation) have replaced the traditional patriotic narrative.

Though *Saving Private Ryan* (1998) was an ode to the veterans of the “Good War,” the patriotic message was undermined by the graphic images of wounds and death and the narrow goal of the soldier heroes—survival. Today, war films are more likely to picture casual slaughters, chaos, atrocity, and posttraumatic stress disorder than national ideals. The idea of the experience of war as meaningful, patriotic, romantic, or glorious has faded to black.

To appreciate how these war films become “history” and how cinema history is framed for viewers, note the method employed by the historian Paul A. Cohen in his study of the Boxer Rebellion in history and memory. He argues that an understanding of the past can best be reached through an analysis of history as event (history as reconstructed or narrated by historians), history as experience (history

from the point of view of the participants), and history as myth (present-minded or usable history). All three approaches have merit and all three speak “the truth.” The same triangulation can provide a framework for understanding war films (feature films as opposed to documentaries) of the late 20th and early 21st centuries:

1. War films as event (docudramas)
2. War films as experience (films that focus on the intimate experience of war and combat)
3. War films as myth (films that seek to use history for some political, racial, or ideological purpose)

The categories are not exclusive, however, and frequently overlap.

Consider the two developments in the technique of filmmaking that have irrevocably changed the visual image of war films. The first is Stephen Spielberg’s recreation of the American landing at Omaha Beach on D-Day in *Saving Private Ryan*: The washed-out color, the imitation of combat cameras, and especially the graphic violence have forever altered the vicarious experience of war—no longer do soldiers die as if they are fainting or falling asleep. Such realism has become the model representation of combat.

The second major influence is the digital revolution (computer-generated imagery), which has largely replaced conventional optical effects and allows war movies to show vast numbers of men and equipment through virtual reality and at a fraction of the cost to previous moviemakers. Before computer-generated imagery, film required an army of extras or actual soldiers and equipment as in *The Longest Day* (1962), *A Bridge Too Far* (1977), *Patton* (1970), and *Waterloo* (1970); now computer software can be employed instead. See, for example, the re-creation of the Japanese attack on the American battleships in *Pearl Harbor* (2001), the British army at the Battle of Cowpens in *The Patriot* (2002), the Lafayette Escadrille in *Flyboys* (2006), or the Battle of Thermopylae in *300* (2006).

The War Film as Event

Docudramas attempt to re-create wars or particular battles but are not documentaries. They portray historical figures or composite figures to come as

A movie poster for *A Bridge Too Far*—this movie from 1977 was filmed before the digital age enabled computer software to create battle scenes through a virtual reality.

close to history as event as understood by the writers, directors, and historical advisers. *The Longest Day* (1963) re-created D-Day from both the Allied and German sides. *Tora, Tora, Tora* (1970) restaged the attack on Pearl Harbor from the Japanese and American perspectives. *Valkyrie* (2008) reenacted the attempted assassination of Hitler by German officers. Such films tend to exclude romantic subplots and claim to present a detached “historical” image of the event.

Gods and Generals (2003) is a “prequel” to *Gettysburg* (1993) focusing on Thomas “Stonewall” Jackson from the beginning of the war to May 1863, when he was killed by friendly fire. The film also focuses on Joshua Lawrence Chamberlain of the 20th Maine. The battles of First Bull Run,

Fredericksburg, and Chancellorsville are featured in the original 5-hour version. It is a pro-Southern, heroic interpretation of the war that goes against the grain of recent films by emphasizing the glory of battle—a “museum movie” according to one critic.

Silmido (2003), a South Korean film based on a military uprising in the 1970s, begins in January 1968, when 31 North Korean commandos enter South Korea and try, but fail, to assassinate the president of South Korea, Park Chung-hee. To retaliate, South Korea gathers a team of 31 outcasts and criminals (a Korean version of the “Dirty Dozen”). The mission is eventually recalled, and to keep it a secret, the South Korean intelligence agency decides to eliminate the men. Learning of the plan, the men escape and try to get to Seoul to tell their story. They are trapped and commit mass suicide. A follow-up investigation report is filed away and ignored.

Joyeux Noel (2005) tells of the famous Christmas “truce” on December 24, 1914, during which British, French, and German troops met in no-man’s-land to exchange greetings and share a common respect among the men on both sides: “The country? What does it know of what we suffer here? Of what we do without complaint? Let me tell you, I felt closer to the Germans than those who cry, ‘Kill the Krauts!’ before their stuffed turkey!” The film ends with an Anglican priest exhorting the men to hate the enemy. It is an antiwar message based on a true incident.

Charlie Wilson’s War (2007) is the story of Wilson, a Congressman, who, along with a Central Intelligence Agency agent, organizes support for Afghan mujahideen to resist the Russian occupation of Afghanistan.

Wilson: What is U.S. strategy?

The agent: Most strictly speaking, we don’t have one. But we’re working on it.

Wilson manages to funnel funds to his group. His efforts evolve into the Reagan Doctrine designed to support anticommunist resistance all around the world. But Wilson’s proposals are frustrated when the American government loses interest in the remote region with eventual tragic consequences after the Russians withdraw from the country.

Defiance (2008) is based on the true story of the four Bielski brothers, who operate as Soviet partisans, saving Polish Jews and recruiting them to

fight the Germans; but the tone of the film is bitter: “Merciful God,” one character prays,

we commit our friends—Ben Zion and Krensky—to You. We have no more prayers, no more tears; we have run out of blood. Choose another people. We have paid for each of Your commandments; we have covered every stone and field with ashes. Sanctify another land. Choose another people. Teach them the deeds and the prophecies. Grant us but one more blessing: take back the gift of our holiness. Amen.

The Alamo (2004), unlike the 1960 John Wayne patriotic version, attempts to present the viewpoint of both sides—Mexican and American. In a revisionist departure from all other versions, Crockett is seen being executed after surrendering rather than fighting to the death as the heroic legend would have it. *The 9th Company* (2005) is a Russian film about their Afghan war. A group of recruits leave home, are subjected to brutal training, and are caught in a savage battle with the mujahideen. The film is loosely based on a real battle in early 1988 at a place called Hill 3234 during one of the last Russian military operations. In the film, only one soldier survives; the rest are forgotten by the military leadership. In reality, the attack by 200 to 250 mujahideen on January 7 and 8, 1988, was repulsed 12 times by the Russian troops, who lost 6 men and had 28 wounded out of a total of 39. This was the first big-budget, big-screen Russian film about the failed war in Afghanistan. *Shake Hands With the Devil* (2007) is based on the Canadian general Romeo Dallaire’s account of his failed multinational peacekeeping assignment in Rwanda during the genocide in 1994. He begged the United Nations to intervene effectively to stop the slaughters but to no avail—a fierce critic of the failure of the West and the United Nations to take effective action, Dallaire is a witness “to what the rest of the world doesn’t want to see.” *Atonement* (2007) re-creates the British defeat at Dunkirk. But the image is one of chaos and indiscipline rather than heroic retreat.

Other movies in the film-as-event category include *Blackhawk Down* (2002), an account of the failed American intervention in Mogadishu in which 18 elite American soldiers were lost, and *We Were Soldiers* (2002), the Battle of the Ia Drang Valley in Vietnam, a costly battle involving

400 American soldiers surrounded by 2,000 North Vietnamese troops. It is a story of faith and heroism. Nevertheless, the narrator says,

There were no bands, no flags, no honor guards to welcome them home. They went to war because their country ordered them to. But in the end, they fought not for their country or their flag, they fought for each other.

The War Film as Experience

Fighting for each other is the theme in films that focus on the experience of combat. They emphasize group loyalties and the personal, intimate experience of war. Such films see combat in terms of the fear of exhibiting cowardice, survival, and loyalty to one's comrades—history from the bottom up. This trend in war films also reflects the trend in military history since the appearance of John Keegan's seminal book *The Face of Battle* (1976), which emphasized the agency and experience of the common soldier over the narrative of kings and generals. The combat or other wartime experience is like a pixel in a photograph—only one small particle in a larger picture but essential to it. Greater causes (e.g., the defeat of fascism) are peripheral if not absent all together. *Band of Brothers* (2001) is a 10-part miniseries about World War II adapted from a book by the historian Stephen Ambrose. Steven Spielberg followed up on *Saving Private Ryan* by producing this program that centers on E (Easy) Company of the 2nd Battalion, 506th Parachute Infantry Regiment of the 101st Airborne Division. The series depicts events told to Ambrose in interviews with surviving members of E Company. "The only hope you have is to accept the fact that you're already dead," one of the paratroopers says. "The sooner you accept that, the sooner you'll be able to function as a soldier is supposed to function: without mercy, without compassion, without remorse. All war depends upon it." *Cold Mountain* (2003), based on the novel by Charles Frazier, is set prior to the start of the Civil War and gives way to an account of the bloody Union defeat at the Battle of Crater. Revolted by his experience of war, a Confederate soldier deserts and walks back to his home in North Carolina. It is a tale of meaningless violence both on the battlefield and on the rebel home front: "I ain't getting shot again for some cause I don't believe in," the deserter-hero states.

No Man's Land (2001), set in Bosnia, depicts war as a black comedy. Two soldiers from opposite sides—a Bosnian Muslim and a Bosnian Serb—both wounded in battle find themselves in a trench along with a third man unable to move because he is transfixed by a booby-trapped antipersonnel mine. Sent to help, the local UN commander leaves the scene revealing the impotency of the peacekeepers and the utter senselessness of the conflict. At the end, a cameraman asks: "You're sure you don't want me to film the trench?" The correspondent replies reflecting the futility of the war: "No. A trench is a trench. They're all the same." *Taegukgi* (2004) is a Korean film influenced by the story frame and photographic techniques of *Private Ryan*. The movie focuses on the Korean War and how it affects two brothers (a metaphor for the division between North Korea and South Korea). The title of the film comes from the name of the prewar flag of Korea and the post-war flag of South Korea. "I wish this was all just a dream," one brother says to the other, "I want to wake up in my bed, and over breakfast, I'd tell you that I had a strange dream. Then I would go to school, and you and mom would go to work."

Two films by Clint Eastwood form a diptych about the Pacific War and the universality of sacrifice by the common soldier: *Flags of Our Fathers* (2006) tells the story of the six men in Joe Rosenthal's iconic photograph of the raising the American flag on Iwo Jima and the impact of this event on their lives. Following the battle, the film takes up the events in the lives of the survivors after the Rosenthal photograph has a huge impact in America. It is a message of how courage is used and misused for national purposes and the unhappy effects on individual lives. "I know it's a good thing, raising the money and that, 'cause we need it," the actor playing the real Ira Hayes says, "But, I can't take them calling me a hero. All I did was try not to get shot. Some of the things I saw done, things I did, they weren't things to be proud of." *Letters From Iwo Jima* (2006) was released in the same year, opening first in Japan. It tells the story of the battle from the Japanese perspective. In 2005, Japanese archeologists are investigating tunnels on Iwo Jima. The movie then flashes back to 1944 where the Japanese are digging fortifications in anticipation of an eventual American invasion. The film ends with the archeologists finding a bag of buried letters. The message: The so-called fanatical Japanese soldiers

were no less human than their marine opponents. “You are quite a soldier,” a Japanese general says to one of his men. “No, just a simple baker,” he replies.

Generation Kill (2008) is based on the book by Evan Wright. An embedded reporter follows the fortunes of the 2nd Platoon of Bravo Company, 1st Reconnaissance Battalion in Iraq. The series begins with marine scouts preparing to invade Iraq and follows them through the invasion where they come face to face with the reality of the war and its aftermath, both for them and for Iraqi citizens. In the conclusion, the men see themselves on a video made by one of the team—as it plays out, they leave the room one by one overcome by the images of death and the futility of it all. “You’re incompetent, sir,” a marine says to his officer. “I’m doing my best,” he replies. In *1968 Tunnel Rats* (2008), soldiers attack the elaborate Viet Cong tunnel systems. In the fight, both sides come to see the worst in themselves revealed. There is a tie-in video game based on the movie—a perfect comment on the growing influence of the digital revolution. *Rescue Dawn* (2007) is based on Werner Herzog’s 1997 documentary *Little Dieter Needs to Fly*. Filmed in the jungles of Thailand, it is the story of a German-born U.S. pilot who is shot down over Laos in 1964. He is tortured and imprisoned, but he escapes. Although released to the public on July 4, the movie actually focuses on a personal story of survival—“No, I never wanted to go to war. I just wanted to fly,” the hero says.

Three Israeli films cover the frustrating war in Lebanon in 1982: *Beaufort* (2007); *Waltz With Bashir* (2008), which uses cartoon images of real and composite characters to tell the story; and *Brothers at War* (2009) about members of a tank crew. All three pictures focus on the experience of war by common soldiers and all three send clear antiwar messages. In *Waltz*, a veteran laments, “After the . . . invasion I lost all my memory. Now I’m looking for those who can never forget.”

Of the Iraq war films, the typical message is one of betrayal, atrocity, grief, prisoner abuse, and post-combat disorders: See, for example, *Home of the Brave* (2006), *In the Valley of Elah* (2007), *Battle of Haditha* (2007), *The Mark of Cain* (2007), *Redacted* (2007), and *The Messenger* (2009). *Saving Jessica Lynch* (2003) told the true story of the rescue of an American prisoner of war, but the “heroic” details were later revealed to be inaccurate; the film is more important for its portrayal of “good” and

“bad” Arabs and the concept of The Other. *The Hurt Locker* (2009) is the story of an explosive ordnance disposal unit. It offers a narrative centering on action and the appeal (“adrenaline fix”) of combat. The movie opens with this quotation: “The rush of battle is often a potent and lethal addiction, for war is a drug.” The hero is a loose cannon who thrives on the thrill of bomb disposal. There is no higher motivation.

The War Film as Myth

War films as unalloyed tribute to the values of patriotism or imperial dreams have disappeared in the 21 century. In their place are films that reflect revisionist war stories, identity politics, and unappreciated sacrifice. Edward Zwick’s *Glory* (1989) depicts a story of the 54th Colored Volunteer Regiment in the American Civil War at the Battle of Fort Wagner. It set the stage for other war films recounting the wartime contributions of minorities. Interestingly, unlike the majority of post-Vietnam War films, there is no graphic violence as in the now common *Private Ryan* method; the soldiers, more important, do have a higher cause than mere survival or comradeship—racial justice. But as one private tells the White colonel: “We ante up and kick in, sir. But I still don’t want to carry *your* flag” [*italics added*]. *Windtalkers* (2002), directed by John Woo, deals with the Native American contribution to the war as radiomen in the Marine Corps whose esoteric language confuses the Japanese. *Days of Glory* (2006) is an Algerian *Private Ryan*. In North Africa, many indigenes (Algerians, Tunisians, and Moroccans) were recruited into the first French army of the Free French Forces. While in transit, they learn of the discrimination that pervades the French army. The film ends with the sole survivor, now an old man, visiting the graves of his fallen comrades. *Miracle at St. Anna* (2008) is director Spike Lee’s Black *Private Ryan*—a tribute to soldiers in World War II who face discrimination and racist officers but fight heroically. (Lee had been publically critical of Eastwood for not including Black marines in his Iwo Jima movie.)

In *A Very Long Engagement* (France, 2004), a variation on the theme in Stanley Kubrick’s 1957 antiwar classic *Paths of Glory*, five soldiers mutilate themselves to avoid further combat in trenches of the Somme. The film views them as tragic hero-victims

and their commanding officer as a murderous lecher. This is a “postheroic” film that fits the context of the historian James Sheehan’s *Where Have All the Soldiers Gone?*: “The eclipse of the willingness and ability to use violence that was once so central to statehood has created a new kind of European state, firmly rooted in new forms of public and private identity” (p. 221).

War Films and the Loss of Mastery

Consider how far the notion has changed of what constitutes a war story when there is no grand narrative. Zoltan Korda’s *The Four Feathers* (1939) was a rousing tale of courage and comradeship culminating in the victory of the British Expeditionary Force over the army of the Mahdi in the Battle of Omdurman in 1885. Truly, a boy’s own adventure. When the remake of the *Four Feathers* by Shekhar Kapur appeared in 2002, the film ended not with the real history of an imperial victory but, incredibly, with a British defeat: History turned upside down. As one British officer says to another in Kapur’s historical imagining,

You may be lost, but you are not forgotten. For those who have travelled far, to fight in foreign lands, know that the soldier’s greatest comfort is to have his friends close at hand. In the heat of battle it ceases to be an idea for which we fight. Or a flag. Rather we fight for the man on our left, and we fight for the man on our right. And when armies are scattered and the empires fall away, all that remains is the memory of those precious moments that we spent side by side.

In the 21st-century war film, courage under fire is understood only as bravery in the face of confusion, chaos, violence, atrocity, and national and imperial delusions—existential courage. If there needs to be further proof of the transformation of the war story, see the director Quentin Tarantino’s phantasmagoria of sadism and violence—*Inglourious Basterds* (2009)—the director’s Jewish *Dirty Dozen* about revenge and the fiery assassination of the top Nazi leaders in a movie theater. (The movie poster shows a German helmet hanging from a bloody baseball bat.) This motion picture is so unhinged from the reality of history that it demonstrates that the war film genre in any traditional or triumphalist understanding has

come to a dead end. As one of Tarantino’s characters says, “I am going to burn down the cinema. . . .”

WAR IN AFGHANISTAN

The Afghanistan war of the 21st century began when the global terrorist organization, al Qaeda, attacked the United States on September 11, 2001. At that time, al Qaeda’s main bases were located in Afghanistan, under the auspices of the Taliban government, then in control of much of the country. Since the attack (known as 9/11), the United States has led an international coalition of allied nations to secure a peaceful, terrorist-free Afghanistan as part of its ongoing effort to combat terrorism worldwide.

This conflict traces its roots in the Cold War. The Soviet Union militarily intervened in Afghanistan in 1979–1989 to secure a communist government on its border. The United States supported anti-communist insurgents at the time, some of whom later joined the Taliban or otherwise turned against the United States and its allies after the Soviets withdrew, which

ultimately led to the attack of September 11, 2001. On May 1, 2011, U.S. counterterrorist units killed Osama bin Laden, al Qaeda's founder and the mastermind of the 9/11 attacks. Meanwhile, the International Security Assistance Force (ISAF) efforts in Afghanistan continued, with the eventual aim of transitioning security responsibilities to the Afghans and withdrawing ISAF forces by 2014, followed by further international aid pledged through 2024.

This entry outlines the evolution of U.S. involvement in Afghanistan, paying special attention to the creation of ISAF and its counterinsurgency (COIN) campaign. Created under a UN mandate, the ISAF mission has been to support a more democratic Afghan government capable of securing itself, to counter the insurgency against the government, and to stabilize Afghanistan by implementing reconstruction and socioeconomic development programs. ISAF faced the same hard lesson learned by the Soviets during their occupation of Afghanistan, namely, that security gained through successful military operations was short lived unless reinforced or protected by strong political institutions rooted in local traditions as well as geopolitical arrangements suitable for regional stability where many neighboring powers compete for influence in or around Afghanistan. After outlining the evolution of U.S. involvement in Afghanistan, this entry concludes by underscoring Afghanistan's geopolitical importance and the strategic threats this region poses to U.S. national security should it again become a safe haven for terrorists. The dangers of befriending the enemy of one's enemy—a strategy that lies at the heart of this conflict—require longer term strategic vision to manage the risks.

Afghan War's Cold War Roots

During the Cold War between Russia (formally known as the Union of Soviet Socialist Republics or the USSR) and the United States, America's strategy was dedicated to containing and eventually defeating communism. When the USSR invaded Afghanistan, the United States supported those who resisted the new communist regime.

Afghan Communists and Soviet Intervention

The Communist People's Democratic Party of Afghanistan (PDPA), as well as anti-communist Islamic groups, formed in the 1960s during the

relatively prosperous and peaceful rule in Afghanistan of Western-friendly King Zahir Shah. In 1973, the King's nephew and prime minister, Mohammad Daud Khan, led a coup that overthrew the monarchy. Daud became Afghanistan's president. In April 1978, a PDPA coup known as the *Saur Revolution* replaced Daud's rule with a communist government. PDPA had two warring factions: *Parcham* and *Khalk*. The *Khalk* leader, Nur Mohammad Taraki, became president; Taraki's protégé, also of *Khalk*, Hafizullah Amin, became second in command; and *Parcham* leader, Babrak Karmal, became third in command of the new state. The Afghan people, however, rejected PDPA's socialist reforms (including atheism, equality for women, and land redistribution), which undermined Afghanistan's Islamic, tribal, and feudal traditions. Political persecution further spurred resistance. Islamic groups led an armed insurgency against the communist rule.

To combat this growing insurgency and threats of foreign interference (particularly from the Islamic Republic of Pakistan and the Islamic Republic of Iran, each of which supported several different insurgent groups), PDPA repeatedly appealed to the USSR for direct military involvement. Initially, Soviet leadership chose to offer PDPA a generous aid package of military hardware and advisors but rejected the Afghan communist government's requests for direct military intervention. Nevertheless, when PDPA's factional strife culminated in Amin's killing of Taraki, Soviet leaders ordered their *spetsnaz* (Special Forces) to kill Amin in late December, 1979, and installed Karmal as the head of state. However, these changes failed to stabilize Afghanistan, eventually forcing the USSR to deploy more than 100,000 ground troops within Afghanistan attempting to quell the ongoing insurgency.

Insurgency

The insurgents were known collectively as the mujahideen (Islamic holy warriors). They had different political visions for Afghanistan, reflecting the country's complex social, tribal, ethnic, and religious composition. Religiously, Afghanistan is split between the roughly 80% majority of Sunni Muslims and a Shia minority. Ethnically, the Pashtuns (about 42% of the population) have traditionally ruled the state and lived concentrated mostly in the south and east of Afghanistan as well

as in the neighboring Pakistan (their ancestral lands predate modern borders). The Tajiks (who constitute about 27% of the population), Uzbeks (9%), and Turkmens (3%) concentrate mostly in the north and west of Afghanistan (bordering the ethnically similar Central Asian regions, then USSR's nominally quasi-independent Tajik, Uzbek, and Turkmen Socialist Republics). The mostly Shia Hazara (about 9%) populate the center. Other and mixed ethnicities live throughout Afghanistan. Family relations and tribal code shape allegiances and order. These lasting distinctions affected insurgent power bases and international politics surrounding the war. Insurgent groups were led by various political and religious figures (based mostly out of Pakistan or Iran) and often had different field commanders for combat operations inside Afghanistan.

Groups and Motivations

Many insurgent groups operated inside Afghanistan. Dominant among them were the Sunni groups, known as the Alliance of Seven, supported mainly by Pakistan and the United States (as well as Saudi Arabia and China, among others), and the Shia groups, known as the Union of Eight, supported mainly by Iran. Alliance and union were rather loose terms.

The Sunni Alliance of Seven groups (also known as the Peshawar Seven) headquartered in Peshawar, Pakistan. Among them, the more religiously radical and fundamentalist (first four on the following list) sought to establish a theocratic Islamic state in Afghanistan, whereas others were royalist or emphasized other Afghan traditions:

1. Hezb-i-Islami (Party of Islam), led by a Pashtun engineer, Gulbuddin Hekmatyar (who was originally from Afghanistan's north, where the Pashtuns are a minority), became a ruthless fighting force that lacked a concentrated local power base but was linked to powerful religious and political forces, such as the Muslim Brotherhood, throughout the Middle East.
2. Hezb-i-Islami (Khalis) was a breakaway faction of Hekmatyar's Hezb-i-Islami led by a Pashtun cleric and former schoolteacher, Yunus Khalis. It had strong traditional support in southeastern Afghanistan, as well as powerful commanders such as Jallaluddin Haqqani and Abdul Haq (both Pashtuns).
3. Jamiat-i-Islami (Islamic Society), led by a Tajik professor Burhanuddin Rabbani, operated mainly in the ethnic minorities-dominated north and included the legendary field commander and political leader Ahmad Shah Massoud (a Tajik, who controlled the strategic Panshvir Valley near Afghanistan's capital, Kabul).
4. Ittihad-i-Islami (Islamic Unity), led by a Pashtun former professor and Wahhabi Islam adherent, Rasul Sayyaf, operated near Kabul with Saudi Arabia and Muslim Brotherhood support.
5. Harakat-i-Inqilab-i-Islami (Islamic Revolutionary Forces), led by a Pashtun cleric, Nabi Mohammadi, favored monarchy and attracted tribal and religious leaders in the south and east.
6. Mahar-Milli Islami (National Islamic Front), led by a Pashtun hereditary master (Pir) of Qadiri Sufi order, Ahmed Gailani, was based in the south and sought to restore the King.
7. Jabha-i-Nijat-Milli (Afghan National Liberation Front), led by a Pashtun Sufi leader, Sibghatullah Mojaddedi, was likewise a royalist group in the south.

The Shia Union of Eight groups relied primarily on Iran, which at the time of the Soviet invasion of Afghanistan in 1979 had just undergone the Islamic Revolution. These groups sought the ultimate goal of transforming Afghanistan into an Islamic republic similar to Iran led by the Grand Ayatollah Khomeini (and, in the shorter term, checking the influence of the Sunni Alliance of Seven):

1. Hezbe Allah (Allah's Party), led by a Shia mullah, Kari Akhmad Yakdaste, operated mainly in the west and south seeking to export Iran's Islamic revolution to Afghanistan.
2. Nasr (Victory), led by Shia sheiks, Abdul Ali Mazari and Shafak, also promoted Iran and operated in the Hazara-dominated center of Afghanistan known as the Hazarajat.
3. Islamic Revolutionary Guard Corps of Afghanistan, controlled by Iran's Islamic Revolutionary Guard Corps and led by Akbari, likewise pursued Iran's interests operating in Afghanistan's central provinces.
4. United Front of the Islamic Revolution consisted of four Shia organizations (the Young Mullahs

of Afghanistan, Islamic Society of the Tawheed School, Islamic Society Fighters, and Movement of the Disadvantaged), which supported the recognition of Khomeini as the worldwide leader of Islam and establishing an Iran-like Islamic Republic in Afghanistan.

5. Islamic Movement of Afghanistan, led by Mohammed Asef Mohseni (Kandahari), cooperated with the Shia Hazara underground forces in Kabul and cities in the southeast and west, as well as with some of the pro-Pakistan Sunni groups, in countering the Afghan communist government. Though headquartered in Iran, this group had an office in Quetta, Pakistan, as well as presence in Afghanistan. Internal strife split it into two: Islamic Movement Kandahari and Council of Islamic Unity.
6. Council of Islamic Unity, led by Ali Beheshti, was a nationalist organization of the Hazara people pursuing withdrawal of Soviet troops and autonomy for the Hazarajat.
7. Organization of Fighters for Islam in Afghanistan, led by Mosbahzade, was a Shia Hazara group that opposed the communist revolution in Afghanistan.
8. Islamic Revolution Movement, led by Nasrullah Mansur, split from the pro-Pakistani Islamic Revolutionary Forces and spread Iran's influence among the Pakistan-based insurgents.

While notorious for their disunity and frequent changes in loyalties and alliances, the mujahideen shared the common goal of ousting the infidels (non-Muslims) from the government and Afghanistan. Mujahideen motivations ranged from jihad (Islamic holy war) to tribal, ethnic, or political allegiances, to personal gain (including from narcotics trade and other illicit activity). Their recruitment drew from local power bases, Pakistan (e.g., Islamic religious schools called madrassas and Afghan refugees), Iran (e.g., Afghan refugees and migrant workers there), and foreign supporters of anti-communist jihad (particularly from the Arab states). Osama bin Laden formed al Qaeda in 1988 in Afghanistan to train and support these jihad fighters.

Strategies and Tactics

In the absence of unified leadership, the disjointed insurgents lacked an explicit common strategy, but

they shared the determination to exhaust, oust, and outlast the foreign forces and their unpopular puppet regime. Harsh Soviet anti-insurgency tactics and ill-suited communist social policies served to further strengthen the mujahideen cause and its popular support.

Insurgent tactics reflected the mujahideen forces' military capabilities and resources. Individual fighters were generally highly motivated and skilled with weaponry, owing to the centuries-old traditions of tribal and anticolonial warfare, but often lacked military discipline and organization. They were also generally hampered by shortages of resources and by military equipment that was broadly inferior to that of the USSR's war machine. As a result, after a series of initial defeats in direct confrontations with Soviet troops, the insurgents came to rely on asymmetric warfare tactics—such as ambushes, subversion, and concealment among civilian populations—where knowledge of local terrain and ties to the native people gave them an edge over the militarily superior outsiders. Insurgent military operations also commonly followed fighting seasons, such as launching offensives during the spring and summer when the mountain snows melted allowing easier cross-border passage, followed by a lull in the winter (as well as around the Islamic holy month of Ramadan when the faithful must fast).

U.S. Support for the Insurgents

The mujahideen pursued different visions for Afghanistan, but their goal of ousting the Soviets matched America's Cold War objectives. The U.S. government thus embarked on a policy of direct political support and covert military aid to the mujahideen. The aid was covert to maintain the ability to deny involvement if necessary for political or other objectives. The weaponry and other military aid from the United States flowed via Pakistan's Directorate for Inter-Services Intelligence, which had local ties to the insurgents. Recipients of U.S. aid included not only the generally pro-Western Massoud, Abdul Haq, and others who would later ally with the United States against the Taliban and al Qaeda but also the fundamentalist Islamists Hekmatyar, Haqqani, and others who would later support or become the Taliban and al Qaeda and fight against the United States and its allies.

American weapons, particularly shoulder-fired Stinger missiles, changed the course of the war by

1986. Easily transportable by foot, these missile systems enabled the insurgents to hit Soviet combat helicopters and low-flying aircraft from the ground more effectively than with common rocket-propelled grenades or light arms fire. This significantly diminished Soviet air advantage, which was essential to its war strategy in mountainous and unfamiliar terrains, leading to fewer military raids into the mujahideen-held territories as well as to the increase in higher altitude bombings and long-distance shelling. However, the resulting loss of precision not only significantly diminished the effectiveness of these tactics in inflicting damage on the mujahideen, but the associated collateral damage further drove the populace away from the USSR-supported PDPA regime and toward the opposition.

Stalemate Prompts Soviet Strategy Change

Soviet leaders underestimated the Afghan resistance and international opposition to the occupation. Without political reinforcement, even successful military actions proved insufficient, as Communist governance failed in the captured territories due to resistance against the new social order as well as government corruption and factional strife. By 1986, the new USSR leader, Mikhail Gorbachev, changed the Soviet approach. The earlier goal of establishing a friendly communist regime gave way to the priority of expedient withdrawal. The Soviet leadership also replaced the faltering Karmal with the more capable Mohammed Najibullah (previously Afghan KGB [Komitet Gosudarstvennoy Bezopasnosty or Committee for State Security]-like secret police/security service chief) as Afghan government leader.

Soviet Withdrawal and Support for the Afghan Government

Even after the Soviets decided to leave, it took 3 years to withdraw all ground troops. A 1988 international agreement known as the Geneva Accords between Afghanistan and Pakistan, undersigned by the United States and the USSR, established a formal February 15, 1989, Soviet withdrawal date. In preparation for and following its departure, the Soviet Union provided massive military and humanitarian aid as well as political support to the Afghan government. The Soviet military supplied, trained, and partnered with Afghan security forces to raise a commando force as well as conventional military, police, local militias, and tribal formations.

The USSR supplied Afghan forces with fuel, equipment, aircraft, tanks, weapons, and other provisions. Soviet and Afghan forces partnered in securing airports, communications, the withdrawal route, an air bridge to Kabul for airlifting vital supplies, and other critical assets. The Soviet military also supplied food, fuel, and other essentials for the Afghan population.

Factional Strife in Afghanistan After the USSR Collapse

The insurgents waited out the Soviet withdrawal and reinvigorated military action against the Afghan government afterward. Soviet strategic planning and massive aid to the Afghan government, however, enabled its survival past the withdrawal of Soviet troops and even beyond the USSR's eventual dissolution in 1991. As the USSR ceased to exist, Soviet aid to Afghanistan ended. While the resources amassed over the previous years may have lasted, the USSR's collapse spelled for Najibullah's government the loss of its strategic external major power patron—in a region where Afghanistan serves as a buffer zone or battlefield for the competing major power interests and proxies. Meanwhile, Najibullah's opponents still enjoyed their external support (e.g., Pakistani and Saudi support for the Sunni mujahideen), and factions within the government had realized the changing fortunes. The Afghan government held until 1992, felled not by military defeat but internal political feuding between *Parcham* and *Khalk* loyalists as well as the eventual betrayals of key government officials and military commanders. In particular, Najibullah's own defense minister, Shahnawaz Tanai, staged a coup, which (although ultimately failed) exposed deep fractures within the government, and one of the strongest Afghan communist military commanders, Abdul Rashid Dostum, with his well-trained and formidable (Uzbek-dominated) forces defected to the opposition—eventually sealing the communist government's fall.

Insurgents Fight Among Themselves for State Power

After the communist government collapsed, the Sunni mujahideen leaders were preparing arrangements to take power in Kabul. Hekmatyar, however, sent his forces into Kabul to seize power for himself. Massoud's forces neutralized Hekmatyar. On April 28, 1992, the mujahideen leaders' Interim Council arrived in Kabul and installed Mojaddedi as an interim president, to be followed by Rabbani

as the president of what became the Islamic State of Afghanistan. Other mujahideen figures also entered the new government. Rabbani maneuvered to remain president through 1996.

The new regime enjoyed little real authority, however. Afghanistan fragmented into areas controlled by local military and political forces such as the former mujahideen or ethnic militia groups, which had also absorbed some of the former communist government and military members. The groups continued to fight among themselves for control of land and power. The fighting nearly destroyed Kabul. Meanwhile, Pakistan and India sought stability and safer routes across Afghanistan to trade with the newly independent Central Asian states (the former Soviet Republics).

Taliban Movement Forms and Wins State Power

A new group called the Taliban offered a vision of order suitable for regional stability and attractive to war-weary Afghans. Led by Mullah Mohammed Omar (a Pashtun and formerly a minor field commander under the Pakistan-based Alliance of Seven), the Taliban movement formed in 1994—with Pakistan's support—from Islamic religious students, some of them mujahideen and former members of the Afghan military (notably, some Soviet-era pilots, giving the Taliban an air force). By that time, the traditional ruling Pashtun elites and institutions were decimated by communist repressions and war, leaving a power vacuum. The ideological, disciplined, and well-funded Taliban filled this vacuum by promising order to the weary and successfully playing the local ethnic and tribal politics and traditions.

The Taliban rapidly captured three fourths of Afghanistan, rolling through Pashtun areas largely unopposed. Initially rebuffed from the north by Massoud's forces near Kabul and Dostum's forces defending the Salang Pass through the Hindu Kush Mountains, the Taliban went around via the Pashtun-dominated east and south and then via the ethnically fragmented west, making deals or fighting. They captured Kabul by 1996 and established the totalitarian Islamic Emirate of Afghanistan based on Sharia law and led by Mullah Omar, who was named the Leader of the Faithful. A religious police for the Promotion of Virtue and the Suppression of Vice enforced law and order with brutal punishments. Taliban government revenues came from Pakistan and al Qaeda as well as from opium and other illicit trade.

Toward 9/11

The Taliban and al Qaeda shared ideology, mutual support, and tangible connections. The Taliban protected al Qaeda and provided it with bases in Afghanistan. Al Qaeda shared the Taliban's radical Islamist ideology and provided fighters for the Taliban as well as training, inspiration, logistics, and networks for global jihad. Al Qaeda also helped the Taliban by eliminating its most serious opponent within Afghanistan, Massoud, whose forces still threatened the Taliban near Kabul. Massoud enjoyed vast Afghan and Western support, and he led a loose anti-Taliban alliance of former mujahideen and other opposition forces known as the Northern Alliance. On September 9, 2001, al Qaeda suicide bombers killed Massoud.

On September 11, 2001, al Qaeda terrorists hijacked four civilian U.S. aircraft on U.S. soil, crashing two into the World Trade Center's Twin Towers in New York City, one into the Pentagon, and one into a Pennsylvania field due to passenger resistance. (The operation followed al Qaeda's earlier declaration of intent and call to kill Americans and their allies in any country.) This attack killed nearly 3,000 people, including Americans and citizens of 80 other nations; damaged the Pentagon; and destroyed the Twin Towers.

After 9/11

Quickly linking the evidence to al Qaeda and the Taliban (for aiding and abetting al Qaeda) for being responsible for 9/11, the United States and its allies responded by initiating a series of direct military and political actions in Afghanistan as part of a global counterterrorist campaign known as the Global War on Terrorism. After the Taliban refused U.S. demands to turn over al Qaeda, these actions included efforts to oust the Taliban from power and destroy terrorist assets as well as provide humanitarian aid for the people of Afghanistan.

Counterterrorist Response Defeats the Taliban and Ousts al Qaeda

Following the 9/11 attacks, U.S. president George W. Bush announced the Global War on Terrorism as part of national security strategy to counter terrorist networks worldwide and governments that support them. Beginning against al Qaeda and the Taliban government in Afghanistan, this strategy aimed to

find, stop, and defeat every terrorist group of global reach. The tactics involved a broad range of means including diplomatic, military, intelligence, financial, and law enforcement actions in coordination with allies around the world.

The Afghanistan military campaign, dubbed Operation Enduring Freedom, commenced on October 7, 2001, and sought to eliminate the terrorist threat using a limited American footprint on the ground. Initial air strikes focused on destroying the Taliban's limited air defenses and communications infrastructure. Small teams of U.S. Special Forces and Central Intelligence Agency operatives were then inserted to make contact with the indigenous anti-Taliban forces of the Northern Alliance (of former mujahideen and local militias) to facilitate offensive action against the Taliban and to call in close air support for bombing enemy positions. The strategically important cities, such as Mazar-e-Sharif, Kabul, and Kandahar, were recaptured from the Taliban in November 2001. The Taliban's control of Afghanistan ended when it surrendered the town of Spin Boldak, the movement's birthplace on the border with Pakistan. The battle of Tora Bora then decimated the al Qaeda forces hiding in this mountain cave complex.

Thus, by December 2001, Operation Enduring Freedom destroyed terrorist bases in Afghanistan, deposed the Taliban regime, and put the remnants of the Taliban and al Qaeda on the run, clearing the way for humanitarian aid delivery to the Afghan people and the eventual establishment of a new Afghan government. However, both bin Laden and Mullah Omar escaped, and many of their fighters found safe haven in the tribal areas across the Afghan-Pakistani border—living to fight another day—and the United States still lacked a longer term campaign strategy for stabilizing Afghanistan to prevent the return of the insurgents/terrorists.

New Afghan Government and ISAF

Central government rulers in Kabul have customarily been Pashtun, deriving their power from the traditional tribal ruling elites. In general, support among the Pashtuns for the Taliban—combined with the Taliban's earlier capture and execution of Abdul Haq, one of the few prominent pro-Western Pashtun mujahideen commanders (during his October 2001 attempt to rally the Pashtuns against

the Taliban)—left the United States and its allies few viable choices to support for leadership of a new government in Kabul.

In December 2001, the UN-brokered U.S.-backed Bonn Agreement established an interim administration, led by Hamid Karzai—a Pashtun with distinguished Durrani tribal lineage that fit the long-standing tradition of rulers in Kabul. Karzai, among others, assisted in defeating the Taliban regime. However (unlike Abdul Haq), Karzai lacked standing as a mujahideen commander and thus lacked a direct prominent role in fighting the Soviet occupation, which limited his de facto power among key factions and the people. His interim government was to convene an emergency *Loya Jirga* (a traditional Afghan grand assembly of tribal and other prominent leaders) in order to facilitate future multiparty elections, constitution development, and parliament formation. A UN Security Council resolution also established the ISAF mandated to create a secure environment in and around Kabul and support the reconstruction of Afghanistan. In 2002, the *Loya Jirga* elected Karzai to lead the Transitional Authority as an interim president for 2 more years.

Meanwhile, al Qaeda and Taliban fighters attempted to coalesce in Afghanistan's eastern provinces but were rebuffed by the United States and Allied forces in Operation Anaconda in 2002. In 2003, the U.S. secretary of defense declared major combat in Afghanistan over. The subsequent shift of U.S. attention and resources in the Global War on Terrorism to Iraq, however, coupled with the Afghan government's inability to consolidate power and stabilize the country, eventually allowed the Taliban, al Qaeda, and various other disaffected parties to regroup and resurge across Afghanistan and the Afghan-Pakistani border, where the mujahideen had enjoyed a safe haven since the Soviet times.

The North Atlantic Treaty Organization (NATO, an originally anti-Soviet Cold War-era military alliance) formally assumed ISAF command in 2003. Later that year, The United Nations extended the ISAF mandate across Afghanistan to assist with overall security and stability, counternarcotics, reconstruction, elections security, and the training of Afghan National Security Forces. A popular vote elected Karzai president of the Islamic Republic of Afghanistan in 2004 and reelected him in 2009. Both elections, however, were marred by low turnouts, alleged fraud, and violence, as well as underlying

problems of the more than 70% illiterate mostly rural population unfamiliar with notions of Western democracy.

Emphasizing its multilateral international approach to assisting Afghanistan, ISAF expanded to nearly 50 troop-contributing nations (by 2012), with the United States and the United Kingdom providing the most troops followed by Germany, Italy, Poland, Australia, Canada, France, and Turkey among others. ISAF expanded in part to counter a growing and spreading insurgency.

Insurgency

The Taliban regrouped, called for jihad, and led an armed resistance against ISAF and the Karzai government, despite the government declaring itself Islamic.

Groups and Motivations

This insurgency displayed many of the Soviet-era characteristics—to the point of involving some of the same groups and leaders—while benefiting from the post-Cold War global economic and political developments. As during the Soviet times, many different groups emerged sharing the common goals of ousting the Afghan government from power and the foreign forces from the country. Again spanning the Afghan-Pakistani border, key groups included Mullah Omar's Taliban and bin Laden's al Qaeda as well as the Haqqani network and Hekmatyar's organization (which had received U.S. support during the Soviet era), among others, such as Pakistani Taliban and other factions. The Taliban continued to pursue its radical Islamist ideology and the goals of reestablishing its theocratic governance incompatible with Western democratic values. The Haqqanis supported the Taliban's aspirations while fighting for political control of their ancestral land (primarily in eastern Afghanistan), where they fought ferociously against both the communists and the West. Al Qaeda shared the Islamist ideology but as a global movement, not as an Afghan nationalist one. The opportunistic as well as Islamist Hekmatyar aligned with the Taliban and al Qaeda.

Strategy and Tactics

By the first decade of the 21st century, globalization eased the movement of terrorist funding, materiel, weapons, people, and information. This allowed

even relatively small local groups a global presence and a strategy of portraying the Afghan struggle in ways that attracted support for themselves (e.g., as protectors of the Muslim faith and land against the infidels) while undermining the Afghan government and ISAF nations' domestic as well as international support for ISAF efforts.

Tactically, the insurgents began to utilize modern technologies (e.g., the Internet for propaganda and recruitment) while continuing to use the tried-and-tested Soviet-era as well as age-old asymmetric warfare tactics on the ground. The extremist Islamist motivations spurred wider use of suicide bombing tactics. Makeshift bombs known as improvised explosive devices emerged as a leading threat to ISAF and Afghan forces as well as civilians. Remnants of Soviet-era parts still found in Afghanistan as well as a variety of other materials (e.g., from fertilizer smuggled from Pakistan to household items) served to make those bombs. Insurgents also utilized more advanced detonation and communication technologies, but they still fundamentally relied on age-old tactics of hiding among the population, leveraging local ties, and exploiting Western values against hurting civilians. They rarely fought direct battles but rather utilized ambush, rocket attack, and hit-and-run tactics followed by disappearing into the mountains or the countryside, planted improvised explosive devices and mines, or conducted deception and suicide bombing-based operations, including using ISAF uniforms to infiltrate and attack coalition facilities and personnel. The tactic of infiltrating, turning, or otherwise inspiring members of Afghan security forces to betray and kill their Western partners (incidents known as green-on-blue attacks) grew into a major threat as the ISAF campaign evolved. Such attacks eroded not only security but also ultimately the trust needed for the joint coalition-Afghan operations at the core of what became ISAF's COIN and Afghan forces' training mission.

Security Deterioration

Prompts U.S. Strategy Change

After a relative lull in 2003, insurgent violence increased by 2006 driven by Taliban resurgence in the east and south of Afghanistan, where its Pashtun ties allowed access to resources and safe havens along the Afghan-Pakistani border and leveraging

the relative decline in attention as the United States and its allies focused on the war in Iraq. The Afghan government's corruption and inability to establish power and services in many rural areas (the same problem faced earlier by the Soviets) contributed to popular unrest and insurgent re-infiltration of the cleared areas.

Whereas the initial post-9/11 goals of the United States and its allies focused on eliminating the terrorist threat posed by al Qaeda and its Taliban benefactors, the growing insurgency threatened to undermine the non-terrorist-supporting government in Afghanistan. Such a government was necessary for the success of U.S. national security strategy toward eliminating any future terrorist threats emanating from this region. In an attempt to stabilize Afghanistan, the U.S.-led campaign eventually (by 2009) evolved from counterterrorism to a population-centric counterinsurgency dubbed COIN (with continued counterterrorist operations).

Population-Centric Counterinsurgency

Protecting the People

The new COIN campaign focused on protecting and gaining the support of the population to defeat the adaptive enemies who hid among, used, or terrorized the people. This approach relied on *The U.S. Army/Marine Corps Counterinsurgency Field Manual* (FM 3-24) developed under the leadership of U.S. Army general David Petraeus (later appointed ISAF Commander) and U.S. Marine Corps general James Mattis, among others. The manual was published in 2006 and, by 2007, proved itself by helping turn the tide against an Islamist insurgency in Iraq (a different battlefield in the ongoing Global War on Terrorism).

In Afghanistan, the COIN principles were advanced, in particular, by the U.S. Army general Stanley McChrystal, who became the commander of ISAF in 2009, and his successor as commander of ISAF, General Petraeus. Afghan COIN campaign focused on undermining the insurgency by growing trusted networks among the population to be accomplished by winning the population's "hearts and minds" with better security, economic development, and improved governance. In this context, the military operations against violent insurgents also continued, but often under the constraints of minimizing civilian casualties including restricting many

ISAF troops' Rules of Engagement for using deadly force against the insurgents. (Restrictive Rules of Engagement often risked greater ISAF casualties and morale setbacks in the service of the population-centric COIN strategic goals.) The ultimate success of this COIN approach, however, relied on the political stabilization of an Afghan government accepted by its people and capable of providing domestic security and checking global terrorist threats emanating from its territory. The challenge and potential flaw of this approach was that the ISAF troops had little direct influence over such outcomes, which only could be achieved by the Afghans themselves. ISAF's COIN lines of effort sought to facilitate such outcomes by supporting Afghan governance, reconstruction and development, and security—each facing substantial difficulties.

Governance

Pursuing Afghan government stabilization, ISAF promoted democracy and Western notions of the rule of law in a traditional tribal society unaccustomed to such norms as well as in a country afflicted with corruption and violence. As during the Soviet times, military successes risked dissipating without political reinforcement. Post-Soviet experience also showed that intragovernmental factional strife was a potentially more lethal problem to the government than the insurgency. Attempts to negotiate and reconcile with the Taliban and other extremist factions threatened a return to a terrorist-friendly tyranny.

Reconstruction and Development

The ISAF established Provincial Reconstruction Teams to support the COIN mission by securing areas where other national and international, including nongovernmental, organizations conducted reconstruction work and humanitarian assistance aimed to improve Afghans' economic and living conditions undermined by war and lawlessness. Prior experience of relative economic development under King Zahir Shah has offered hope, but the Afghan government's reliance on billions of dollars in foreign aid and questions about the effectiveness of its use, as well as widespread corruption and misuse of aid, have challenged the prospects for Afghanistan's economic viability and future development. Illegal narcotics and other criminal activities were prevalent in the country's economy.

Security

Security was intended to support governance, reconstruction, and development. The U.S. and other ISAF forces succeeded in many operations. ISAF combat operations as well as mentoring, training, equipping, and partnering with the Afghan National Security Forces sought to quell the insurgency and help Afghans to eventually secure themselves. The earlier Soviet success in fielding a capable Afghan military has offered hope, but low Afghan literacy levels, defections, insurgent infiltration, and fratricidal attacks have challenged progress. Lacking strategic and political solutions, security in many locations was fleeting despite numerous valorous military achievements. The Taliban and their allies continued to launch offensives and terrorize the population particularly in the east and south of Afghanistan where they benefited from the Pashtun tribal ties as well as safe havens and reinforcements across the Pakistani border. NATO operations cleared many insurgent strongholds, but lack of governance often allowed the insurgents to return. The ongoing insurgent activity as well as high-profile attacks, including an attempted assassination of President Karzai, prompted a 2009 U.S. policy review to recommend a surge in U.S. troops in support of the COIN effort.

U.S. Withdrawal Announcement Undermines Troop Surge Objectives

Successful execution of the adopted population-centric COIN required more time and additional ground troops. ISAF coalition forces reached approximately 67,000 by 2009 and surged to more than 130,000 several months later (akin to Soviet-era levels) largely due to the addition of 30,000 U.S. troops per President Barak Obama's surge policy, announced in December 2009 following a policy review that endorsed the COIN approach. Thus, by 2009, the United States had developed an integrated COIN campaign but resourced it with fewer troops than originally requested by the then commander of ISAF General McChrystal. Moreover, in the same speech, the president announced both the surge as well as the commitment to begin troop withdrawal in 2011, producing deleterious strategic effects: The surge provided more targets (constrained by the COIN Rules of Engagement) for the enemy to attack but not enough troops to fully resource the adopted COIN approach. The withdrawal announcement

incentivized the enemy to conserve its main forces for a decisive struggle after the U.S. and ISAF departure, while potentially discouraging the local population and regional players from a commitment to support the government, knowing that its external major power support was waning.

ISAF's 2010 Marja offensive against the Taliban and drug-trafficking strongholds in the southern province of Helmand served as a test for the surge-reinforced COIN approach in partnership with the Afghans. The operation was designed to clear the insurgents while minimizing civilian casualties, then roll out Afghan government services to hold security as well as build the local institutions and capacity for peace, prosperity, and safety. The offensive was announced in advance, forgoing the military advantage of surprise against the enemy in favor of protecting the population. The military operation succeeded in ending the Taliban rule, but the promised governance faltered. Long-term success hinged ultimately on the Afghans' own desire and ability to keep the Taliban and its allies from returning.

By 2011, ISAF in partnership with the Afghan armed forces cleared the Taliban from several of its important safe havens in Afghanistan's south and east (including in Helmand and Kandahar), as well as select areas of the north where the Taliban had spread. Additional gains included holding and helping build better governance capacity in the cleared areas and capturing or eliminating numerous insurgent and terrorist leaders. ISAF also pursued counternarcotics and anticorruption efforts toward fostering an Afghanistan capable of securing and governing itself. However, the corruption and faltering governance created power vacuums, which the Taliban filled by establishing its own shadow governments and conflict resolution methods—brutal but speedy and effective.

Nonetheless, the United States and NATO continued the course of ending their involvement in Afghanistan. The 2012 NATO summits in Lisbon and Chicago produced international agreements to complete the transition of security responsibilities to Afghan leadership as well as the withdrawal of ISAF troops by 2014. International donors pledged continued aid to help sustain the Afghan government through 2024. The government's sustainability and independent viability, however, remained at risk.

Victory was also elusive. Lack of a clear U.S. strategy and political will to win made the hard-fought military gains appear reversible in the absence of political commitment to defeating the insurgents. With the U.S. and other coalition forces drawing down, ISAF transition of security responsibilities to the Afghans relied on recruiting, training, and mentoring the Afghan forces in close partnership and joint operations, but the increasing Afghan fratricidal attacks against their Western partners eroded the trust, curtailing some joint efforts.

If the insurgent patterns of behavior since the Soviet times are indicative, the insurgents may (as they did following the Soviet withdrawal) simply wait out the departure of foreign troops and afterward intensify their quest for power as well as their support for terrorist sanctuaries, which in the past had led to 9/11.

Continued Counterterrorist and Intelligence Operations

Intelligence-driven special operations have continued alongside COIN, including targeted elimination of key terrorist and insurgent figures and their networks in Afghanistan, Pakistan, and beyond. These operations have increasingly utilized unmanned aerial vehicles known as “drones” for intelligence, reconnaissance, and strikes. A covert U.S. campaign to target and kill al Qaeda, Taliban, and allied extremist groups’ leaders and operatives has carried out hundreds of drone strikes since 2004, killing more than a 1,000 targets in total.

High-value targets have also been pursued by manned, often Special Operations Forces, teams to achieve higher precision, ensure mission success, and collect additional intelligence on the ground, among other objectives. Despite higher inherent risks to personnel, these allowed for potentially significantly greater payoff, as seen with the elimination of bin Laden in Pakistan by a Navy SEAL team on May 1, 2011. After bin Laden’s death, al Qaeda’s second in command, Ayman Al-Zawahiri, assumed the organization’s leadership as well as primacy on the U.S. most wanted terrorists list. Al Qaeda has been degraded, but not yet defeated.

Ongoing Regional Challenges and Strategic Lessons

Insurgency and instability across the Afghan-Pakistani region threaten U.S. national security and

strategic interests. Terrorists, trained and operating there, continue to threaten not only their region but also the U.S. homeland as well as allies and assets overseas. The ongoing conflict may have also served to radicalize more individuals into becoming terrorists, particularly martyrs, for religious reasons (fighting infidels) or from having been victims of anti-insurgent activity (analogous to the dynamics during and following the Soviet era, as jihad veterans of Afghanistan spread the fight worldwide).

However, short of victory, a hasty withdrawal, or negotiated settlement with the Taliban and its allies (who had already turned against the United States despite benefiting from the U.S. support against the Soviets) risks the eventual return of a terrorist-friendly tyranny in Afghanistan. Such an outcome in the past had led to 9/11 among other attacks and threats.

In turn, Pakistan seeks influence in Afghanistan to gain strategic depth on Afghan territory as a contingency for a possible war with India. Especially following the bin Laden raid, Pakistan’s reliability as a U.S. ally has been questioned. Pakistan has also sought greater military cooperation with China. The Islamist elements inside Pakistan and their ties with the insurgents threaten the stability of Pakistan’s (as well as Afghanistan’s) government and the security of Pakistan’s nuclear weapons. These weapons may fall into anti-American hands should U.S. influence in the region wane. Iran’s suspected support for the insurgents as well as growing Russian influence in former Soviet Central Asia and ties with the former Soviet ally, India, as well as increasingly with Pakistan, also threaten to undermine U.S. interests in this nuclear-tipped and terrorist-prone region. Understanding and prosecuting the Afghanistan war in its broader geopolitical, socioeconomic, historical, and strategic context outlined in this entry can help develop longer term successful strategies for security, peace, and U.S. leadership in this important region and the free world.

WAR OF 1812

Long-simmering tensions between the United States and Great Britain gave way to war in the late spring of 1812. On June 18, 1812, Congress declared war against Great Britain within days of London's suspension of the Orders in Council, one of the major sources of tension between the two countries. American strategists planned to invade Canada from Detroit and New York state. In the northern theater, American regular and militia forces fought against British regulars, Canadian provincials, and their Native American allies in the Old Northwest, on the Great Lakes, along the Niagara Frontier, and along the northern front from Fort Erie to Montreal. Additional fighting took place along the Chesapeake Bay and in the American South in the Creek War. The latter conflict began as a civil war among the Creek Indians and then expanded to become embroiled in the War of 1812 when the Red Stick faction attacked the settlement of Fort

Mims. Naval activity took place on the Great Lakes, in Chesapeake Bay, along the Atlantic coast, British raiding of coastal towns from Maine to Georgia, and in other isolated confrontations worldwide. American and British peace commissioners signed the Treaty of Ghent on December 24, 1814. The treaty formally went into effect on February 17, 1815.

Causes of War

The tensions that led to war between the United States and Great Britain in 1812 had existed since the 1780s. American foreign policy revolved around commercial interests and to a lesser extent, expansionist aims. America sought to establish itself as a neutral power in order to maintain neutral rights, enabling it to continue trading with warring powers, notably England and France. Americans perceived the British Orders in Council, decrees designed to regulate trade with France, as a violation of their neutral rights. The Orders barred all neutral trade with Continental Europe. The only exception was made for ships that entered a British port and obtained a license to proceed. An additional and particularly onerous British policy included in the Orders was the practice of impressments. The inability to distinguish British subjects from American citizens led to the impressment of at least 3,000 American sailors during England's wars with France during the Napoleonic Era. For the Americans, impressment was an emotionally charged issue—a matter of national pride that topped every list of complaints against British practices. After the *Chesapeake-Leopard* affair in 1807, during which an English warship stopped and boarded an American ship of war, President Thomas Jefferson pursued a course of economic coercion, and Congress passed the Embargo Act in December 1807.

The Embargo was enacted with disastrous results. American commerce suffered more than the British economy. The Non-Intercourse Act of 1809 replaced the Embargo and resumed trade with all countries save Great Britain and France. By 1810, Macon's Bill No. 2 replaced the ineffective Non-Intercourse Act. The bill lifted all restrictions on American trade and gave the president authority to impose nonintercourse on either France or Britain after the other revoked its edicts against the United States. Far from securing neutral rights, this coercive act opened the door for disagreements and

misunderstandings between England and the United States, especially after President James Madison, falling for Napoleon's empty promise that he would respect U.S. neutral rights, resumed trade with France and enacted nonintercourse against England in November 1810.

The vagueness of agreed on boundaries in the 1783 Peace of Paris and dispute over the unsettled Old Northwest served as another source of tension between the United States and Great Britain for 60 years. The Jay Treaty of 1794 provided for the British surrender of northwestern posts in American territory along the Great Lakes occupied since the end of the Revolution. The British handed over the forts in 1796, and a decade of relative quiet followed. Increased tension in the Old Northwest around 1806 corresponded with renewed fighting in Europe. The rise of the Shawnee chief Tecumseh and his brother the spiritual leader Tenskwatawa (the Prophet) galvanized Western support for an invasion of Canada. The Indiana territorial governor William Henry Harrison led militia troops against the Shawnee in 1811. The successful outcome of the Battle of Tippecanoe meant that as the War Hawks, pro-war western and southern Republicans led by Kentucky Congressman Henry Clay, came to power in the Twelfth Congress, they had a solid rallying point to advocate a transition from a defensive posture in the west to more offensive action. While there was a change in tone, the primacy of dealing with commercial transgressions remained. However, there was a growing solidification of popular support once the invasion of Canada was determined to be the only means for confronting Great Britain.

On June 1, 1812, President Madison sent the U.S. Congress a war message. After two close votes in both the House (79–49) and the Senate (19–13), Congress voted for a declaration of war. Madison made the announcement on June 18, 1812. In spite of emphasis on maritime grievances, Madison and his military advisors, including William Eustis, the secretary of war, believed that Great Britain would be most vulnerable to economic pressure by an American invasion of Canada.

The War

Although it initiated the war, the United States was ill prepared for military action. In the first campaign of the war, the Michigan territorial governor

William Hull attempted an invasion of Canada from Detroit to secure Upper Canada. Stiff resistance from Major General Isaac Brock, the president and administrator of Upper Canada and commander of the troops there, resulted in the surrender of Detroit. Additionally, attempts to invade Canada along the Niagara frontier, led by Stephen van Rensselaer and later General Alexander Smyth, also failed. In the northeast, difficulties mustering New England militias stalled the U.S. brigadier general Henry Dearborn's proposed campaign against Montreal.

In spite of leadership changes, American campaigns in 1813 proved as ineffective as those of 1812. Major Generals James Wilkinson and Wade Hampton replaced Dearborn, whose May offensive across the Niagara River at Fort George resulted in no gain. American campaign plans to invade Montreal failed because of rivalry and lack of cooperation between the two generals. On Lake Erie, Oliver Hazard Perry's fleet destroyed an entire British squadron in September 1813, which facilitated William Henry Harrison's recapture of Detroit and American success against the British major general Henry Proctor and Native American allies at the Battle of the Thames. Additionally, Tecumseh's death during the battle ended effective Native American resistance in the region.

American fortunes improved somewhat in 1814, especially with the promotion of effective generals like Andrew Jackson, Jacob Brown, and Winfield Scott. Jackson's success against the Creeks at the Battle of Horseshoe Bend in March 1814 nearly destroyed the Red Stick Creek faction in the Old Southwest, preventing their alliance with the British in the Gulf of Mexico. In preparation for a July invasion of Canada across the Niagara River, Brown first captured Fort Erie and then moved toward Lake Ontario to coordinate maneuvers with the navy. In support of the campaign, U.S. general Winfield Scott defeated British forces opposing the invasion at the Battle of Chippewa, which highlighted the effectiveness of American regulars. Eventually, Brown's advancement stalled, and he withdrew back to Fort Erie, fighting the British lieutenant general Gordon Drummond and brigadier general Phineas Riall at the costly Battle of Lundy's Lane during his withdrawal.

Later in the year, the Americans suffered Major General Robert Ross's August raid into the Chesapeake and the burning of Washington, D.C. However, in September, American forces repulsed British advances against Baltimore, where the naval

bombardment of Fort McHenry inspired Francis Scott Key to pen “The Star Spangled Banner.” Also in September, Lieutenant General Sir George Prevost led British forces south along Lake Champlain into New York. Subsequent American land and naval victories at the Battle of Plattsburgh and Plattsburgh Bay forced the British retreat to Canada.

Naval War on the High Seas

American naval victories in the summer and fall of 1812 proved a welcome contrast to the year’s faltering land campaigns. Because the British navy outnumbered and outgunned the U.S. fleet, the American Navy adopted a strategy of single-ship engagement and attacking British commerce. This strategy yielded stunning success in the early part of the war. In addition to providing an important boost to morale, it forced the British navy to turn its efforts toward defending its merchant fleet.

The streak of American success began when the American frigate *Constitution*, commanded by Captain Isaac Hull, defeated the British frigate *Guerriere* on August 19, 1812, to claim the first American naval victory of the war. When the crew returned to Boston, they were feted with a 500-guest celebration at Faneuil Hall, in spite of New England’s antiwar leanings. In late October, Stephen Decatur’s frigate *United States* captured the British frigate *Macedonian*. In December, the *Constitution*, now commanded by William Bainbridge, earned a second victory over Britain’s *Java* off the coast of Brazil. In addition to these single-ship engagements, the frigate *Essex*, commanded by David Porter, reported an eventful month of cruising, during which the ship captured eight enemy merchant ships and a sloop of war, with more than 400 prisoners and property worth approximately \$300,000 captured or destroyed. These successes reinforced the American strategy of targeting individual ships and British commerce.

To further carry out its naval strategy, the United States turned to privateers to augment its undersized navy. Privateers, romanticized as “militia of the sea,” were privately armed vessels commissioned by the president and authorized by Congress to raid enemy ships in exchange for prize money. More than 500 ships served as privateers compared with the 23-ship U.S. Navy. Motivated by patriotism and profit, privateers took 1,345 British prizes and inflicted an estimated \$45.5 million of damage

on British commerce over the course of the war. By November 1812 alone, American privateers operating off Canada captured 150 merchant vessels. Although the British blockade of the American coast increased the risks and danger for privateers, they continued to operate through the end of the war.

The initial American naval victories stunned the British. To cope with the American strategy, the British increased their presence in American waters and blockaded ports and began sailing commerce vessels in convoys and naval vessels in squadrons. The Admiralty went so far as to order ship captains to avoid single-ship combat. In February 1813, the British navy began a blockade of American ports and harbors on the Chesapeake Bay and Delaware River. Over the course of the year, British vessels bottled up the entrances to New York and Boston and gradually extended a blockade to Charleston, Port Royal, Savannah, and the Mississippi. The blockade proved effective not only in limiting American naval activity by making it difficult for American ships to enter or leave port but also in putting economic pressure on the United States by restricting the free flow of goods.

Additionally, British naval dominance and their effective blockade gave them freedom to send raiding parties against coastal cities. Most of the operations took place in the Chesapeake Bay along the coasts of Maryland and Virginia, where the British launched incursions against various port cities in the summer of 1813. British control over coastal waters facilitated the August 1814 landing of a flotilla of no fewer than four ships of the line, seven frigates, and other vessels carrying Major General Ross’s force of 4,500 that invaded Washington, D.C., on August 24. The British navy’s subsequent attack on Baltimore was motivated by the city’s status as a key port for American privateers. Although slow to exploit their naval strength in the early months of the war, by the war’s end, the British had reasserted their accustomed naval dominance. The efforts of the U.S. Navy, however, had earned the respect of the British and American sailors, and commercial interests at sea would be free of European interference.

Antiwar Sentiment

Congressional Federalists voted against the war, and members of the Federalist Party, particularly in New England, expressed and acted on antiwar sentiment throughout the course of the war. Antiwar

feelings manifested themselves in various ways over the course of the war. The New England Militia Controversy was precipitated by Congress's April 1812 authorization of 100,000 militia men for federal service. In August, after the declaration of war, the governors of Massachusetts, Connecticut, and Rhode Island refused the requisition orders. The governor of Massachusetts appealed to the state's Supreme Court, whose ruling provided the underlying justification for the state's refusal to provide militia troops. The court ruled that national government had the right to activate militia troops only in the event of suppressing insurrections, maintaining domestic tranquility, and repelling foreign invasions. In their estimation, none of those conditions existed. Additionally, the militia was commanded by state officers, except when the president of the United States assumed command. Moreover, the court

did not recognize the president's right to delegate command to military subordinates. These reasons further justified the state's refusal to place militia troops under the command of the First U.S. Military District. The governor of Rhode Island claimed the prerogative to determine if grounds for committing the militia existed and ultimately refused his troops based on his belief that the conditions did not warrant their activation. The governor of Connecticut, supported by the state legislature, similarly refused to commit troops based on the fear that state troops would be used for offensive purposes, namely, the invasion of Canada. The failure of New England states to support the war contributed to the U.S. failures in the northern campaigns. Issues of militia service under regular officers and the authority to call up the militia remained unresolved throughout the course of the war.

In addition to the New England controversy, there were several instances of the militia's refusal to cross into Canada. In the October 1812 Battle of Queenston, New York, militia refused to cross the Niagara River to reinforce American troops pinned down by British fire. Their refusal contributed to the American defeat, a loss that effectively ended the 1812 campaign. The Queenston incident stands out because militia insubordination directly affected the outcome of the battle. It was not, however, the only time the militia refused to cross into Canada. In July 1812, 200 Ohio militia accompanying General Hull refused to cross the Detroit River into British territory. They claimed that they could not serve outside American territory. As General William Henry Harrison's forces pursued British forces in September 1813, 150 Pennsylvania militia refused to cross into Canada. In October, nearly 1,000 militia accompanying General Hampton's attempted invasion of Montreal also refused to cross the border.

Antiwar sentiment also negatively affected financial support for the war. The government's attempt to sell war bonds to finance the war met with limited success. Just half of the March 1812 bond issue was taken by investors. A lack of military success in 1812 as well as New England opposition toward the war foreshadowed meager results for the 1813 bond sales as well. After selling only one third of the bonds, the treasury turned to a syndicate of bankers to underwrite the remainder of the issuance. Ultimately, the government financed approximately \$60 million of its wartime debt through the direct sale of national securities to U.S. investors. However, New England financiers' opposition to the war significantly hampered the U.S. war effort. Of the \$40 million borrowed by the U.S. government by the end of 1814, less than \$3 million came from New England, then the country's richest section.

Federalist antiwar sentiment is most associated with the Hartford Convention. From December 15, 1814, to January 5, 1815, members of the Federalist Party met in closed sessions to discuss dissatisfaction with the federal government's deployment and control of the militia, general frustration with the war, and the party's concern about southern Republican's dominance in national politics. After secret deliberations, the delegates issued a final report and proposed seven constitutional amendments. Delegates from two of the states proceeded to Washington,

D.C., to present their recommendations. Before their arrival, news of Andrew Jackson's victory in New Orleans and the Treaty of Ghent became public. Although the Federalist proposals were mostly moderate, the timing and circumstances of the Hartford Convention caused it to appear disloyal and treasonous. The notoriety of the convention contributed to the Federalist Party's rapid decline following the war.

Ending the War

Peace negotiations began almost in concert with the beginning of the war. Despite Russian attempts to broker a peace deal, it was British war weariness and setbacks at Baltimore and Lake Champlain that convinced the British government to accept the status quo ante as the basis for peace. Importantly, the British dropped demands for changes to the Canadian border and the establishment of a Native American state in the Northwest. Similarly, American peace commissioners, including John Quincy Adams, Henry Clay, and the former secretary of treasury Albert Gallatin, dropped demands for ending impressments and agreed to honor Native American territorial claims.

Peace commissioners signed the Treaty of Ghent on December 24, 1814. Although the treaty restored the status quo ante bellum, it did not meet any of the U.S. wartime objectives. Andrew Jackson's January 1815 victory at the Battle of New Orleans over the British major general Edward Pakenham helped establish the outcome of the war as a victory in the memory of Americans. Additionally, the end of the war neutralized the Native American presence in the Old Northwest and opened large tracts of land to American expansion in the South. American feelings of victory were furthered by the ensuing period of consensus, national pride, and expansion of federal powers, the so-called Era of Good Feelings. Canadians also viewed the outcome as a victory as they repulsed the American invasion, retained their connection to Great Britain, and nursed a burgeoning nationalism. Great Britain also could claim victory as it successfully retained Canada and ceded no commercial claims. Native American participants made few claims of victory as American settlers continued to push them westward in spite of treaty provisions designed to protect prewar territorial possessions. Both the United States and Great Britain benefited from the

arbitration clause of the treaty, designed to facilitate peaceful resolutions of border conflicts.

Statistical Data

More than half a million Americans served during the War of 1812. The historian Donald Hickey estimates the total number of troops to be 528,000: 57,000 regulars, 10,000 volunteers, 3,000 rangers, and 458,000 militia; an additional 20,000 served in the navy and marines. Native American allies numbered about 1,800 in the North at the start of the war, although that number likely grew after the American victory at the Battle of the Thames in 1813. In the South, approximately 2,000 Native Americans allied with the United States against the Red Stick Creeks. For the United States, official battle casualties numbered 2,260 killed and 4,505 wounded. Historians estimate that another 17,000 soldiers suffered nonbattle military deaths. The estimated cost of the war is \$158 million.

When war was declared, historians estimate that the British had some 5,600 regulars in Canada and 86,000 militia on the roles. The only permanent fortress was at Quebec with 2,300 men. By late 1814, British regulars in North America peaked at 48,000, with an additional 4,000 provincials in service; the total number of naval personnel is unknown. Historians calculate that 2,733 British soldiers perished in combat, accident, or disease between 1812 and 1814 in Upper and Lower Canada. Estimates for naval personnel and combatants in other theaters put total British deaths as a direct result of the war at around 10,000. In addition, some 11,000 Native Americans fought with the British in the north. The Grand River Iroquois played a more active role, especially in Upper Canada. In the south, approximately 4,000 Native Americans opposed the United States in the Creek War. For the Native American participants as a whole, an estimated 10,000 men, women, and children died from war-related causes.

Lessons Learned

Following the war, reform-minded politicians tentatively acknowledged the importance of an organized, trained, and equipped regular army to meet the security demands of the nation and to match the fighting prowess of European armies. Although there were no fundamental changes in manpower policy or the militia system, substantial reorganization of the federal administrative system took place, including

establishment of an army general staff, the formation of a board of navy commissioners, and the reform of the system of accountability for the army and navy. Although these reforms set the stage for the further development of a professional staff, the nation largely remained committed to the ideals of the citizen-soldier and the militia.

By 1820, the House of Representatives called for reductions to the regular army. Secretary of War John C. Calhoun argued that the events of the war proved that the regular army, and not the citizens' militia, was the most effective instrument for waging war. To achieve the desired force reduction and center military efforts on a regular force, Calhoun proposed a plan for an expandable regular army. Under his proposal, the peacetime army would be a skeleton force in which all wartime formations would already exist. During wartime, recruits would be absorbed directly into existing units so that recruits would benefit from the skill and guidance of regular troops. Calhoun's proposal met numerical reduction requirements; however, it called for the retention of a disproportionate number of officers. Additionally, it implicitly reduced the militia to auxiliary roles. As a result, Congress rejected the plan. Calhoun's proposed plan was a turning point for the nation's understanding of the value of militia versus the regular army. He was the first responsible statesman to repudiate the militia tradition. In various forms, the concept of an expansible army influenced advocates of the regular army as the focus of war planning through the late 19th and 20th centuries.

Wartime experiences also led the expansion of coastal fortifications. The British navy's ability to enter harbors caused renewed interest in coastal fortifications. Many attributed the presence of Fort McHenry to Baltimore's ability to hold out against British attack. In 1816, Congress appropriated more than \$800,000 for fortifications. From 1817 to 1824, the Corps of Engineers supervised the building of more than \$3 million worth in coastal fortifications. Additionally, the army changed West Point curriculum to promote engineering in response to the need for a system of fortifications. By the mid-1820s, as memories of the war receded, the pace of construction slowed.

Historical Interpretations

Although interpreting the history of the War of 1812 typically generates fewer controversies than studies of other wars, scholars of the war continue to debate key points and expand the literature in ways that

mirror trends in the wider field of military history. In one of the earliest relevant studies, *The War of 1812* (1965), Harry L. Coles summarized the various causes of war that historians have suggested. His list of causes included maritime concerns and the British practice of impressment, the expansionist aims of Western and Southern states, economic depression, national pride, and the use of Canada as a lever to force Great Britain to concede on maritime and commercial interests. Coles himself argued that a combination of factors caused the war, although he advanced the maritime and commercial interests above the others. Several decades later, in *The War of 1812: A Forgotten Conflict* (1989), Donald J. Hickey added the Republican Party's desire to promote party unity as an additional motivation for the war. His inclusion of the internal political dynamics of the nation during the war to commercial and economic interests informed his analysis of the nation's decision to declare war, the conduct of the war, and the terms of peace. Likewise, in *Mr. Madison's War* (1983), J. C. A. Stagg suggested that war against England was the next natural step following Madison's failed diplomatic attempts to secure American maritime rights. However, divisive internal politics and local interests compromised the administration's ability to coordinate war efforts.

Most historians advance some combination of factors as causes for the war, but Alan Taylor's *The Civil War of 1812* (2010) moved past traditional notions of causation and describes the war as a civil war with four overlapping dimensions. Those dimensions included the following: first, a conflict between Loyalists and U.S. republicans; second, a partisan struggle between Jeffersonian Republicans and Federalists in the United States; third, a struggle in Britain with Irish republicans that spilled over into North America; and fourth, different Native American groups divided among themselves as they chose allies in the struggle against American expansion. Taylor's expansive view of the war reflected the trend of placing the war in a wider social and cultural context and including Native Americans as active participants in the war. Sandy Antal (1997) has explored the role of Native Americans in a specific campaign, while Gregory Dowd (1992) and John Sugden (1986) have examined intertribal diplomacy and alliance building as part of the prelude to Native American participation in the war. Additionally, scholars have investigated Native Americans' participation in the war as an agent of social and cultural change.

New scholarship on the war in the Old Southwest has animated debate over Andrew Jackson's conduct during the Creek Wars. In *Old Hickory's War* (1996), historians Jeanne and David Heidler criticized Jackson's leadership and decision making during his military career between 1813 and 1819. In their analysis, he was a self-serving agent of American expansion motivated by his hatred for Native Americans and a personal quest for military glory and political power. In contrast, in *Andrew Jackson and His Indian Wars* (2001), Robert V. Remini, a noted biographer of Jackson, defended Jackson as a wartime leader and as an advocate of Indian removal. Jackson's commitment to Indian removal, Remini asserted, stemmed from Jackson's belief that only geographic separation between Native Americans could prevent ongoing warfare. Although these works offered differing assessment of Jackson's actions, both situate the history of the War of 1812 within the larger literature of American expansion and Native American policy.

As historians continue to expand the scope of their studies, they will necessarily reexamine the war's impact and its meaning for the different participants. New interpretations will certainly shape the ability of historians to determine who won the war. While few support a sure victory for any of the parties, perhaps the most useful model to determine "who won" is offered by Donald Hickey in *Don't Give Up the Ship!* (2006). He suggests that the question can only be answered by considering five distinct groups: (1) The United States; (2) Great Britain; (3) Britain's North American colony, that is, Canada; (4) Native Americans living in the United States; and (5) Native Americans living in Canada. A separate appraisal of each group's goals and achievements as well as an overall assessment of the impact of the war is needed to determine if the group "won" or "lost" the war. While scholars debate the nature of the victory for the United States, they generally agree that the war was solely detrimental to the future of native peoples.

WAR POWERS ACT

The War Powers Act, also known as the War Powers Resolution, was a joint resolution of Congress passed in 1973 that placed statutory restraints on the president's ability to use military force. It was passed during a period of congressional assertiveness in the wake of the unpopular Vietnam War and the emerging Watergate scandal. Notably, the act was passed

over the veto of President Richard M. Nixon, and each subsequent administration has declared it to be unconstitutional. While the passage of the act was a symbolic victory for Congress over the presidency, it has had only marginal effect on the ability of the legislative branch to take back war-making powers that have been assumed by the executive branch during the 20th century.

The purpose of the War Powers Act is to curtail the war-making powers of the president and return a portion of the ability to influence national security policy to Congress. It is a simple piece of legislation that places three major obligations on the president regarding the use of military force: (1) the act requires the president to notify Congress of potential military deployments as early and as often as possible and to accept congressional consult; (2) it requires the president to notify the leaders of Congress of a deployment of the armed forces within 48 hours of action; (3) it requires the president to withdraw deployed troops within 60 days unless Congress votes to authorize an extended deployment or declares war; the president may take a one-time 30-day extension without a congressional vote. While there is no built-in mechanism for enforcement of this law, Congress has grounds for impeachment of the president if he chooses to violate it.

The creation and maintenance of the War Powers Act highlights decades of tension between the president and Congress regarding foreign and defense policy making. Beginning with Franklin Delano Roosevelt's leadership during World War II and intensifying with each subsequent president's management of foreign affairs during the Cold War, the institution of the presidency took a greater role in making foreign and defense policy at the expense of congressional influence. There are several competing explanations for this shift. There is general agreement, however, that the elevated position of the United States in world affairs and the expansion of American grand strategic goals required the federal government to be able to make quick and effective decisions regarding foreign and defense policy. In addition to this thesis, Richard Neustadt (1960) argues that assertive presidential leadership during periods of compliant or submissive congressional leadership intensified this trend.

According to Article I, Section 8 of the Constitution, Congress alone reserves the power and responsibility to declare war against a foreign

country. Congress has done so only five times during its history, despite the fact that the United States has been involved in dozens of military conflicts and hundreds of foreign military deployments since the founding of the Republic. The device of declaring war, therefore, is only one means of war making available to the federal government. The other ways in which the United States can make war rest in the hands of the president, who is also regarded as the commander in chief of the armed forces according to Article II, Section 2 of the Constitution. It has long been clear that the president has been the primary agent of war making in the federal government, yet there is also a long and broad history of the president working with Congress. A tradition of consultation and mutual consent largely came to an end with the changing dynamics in international relations in the mid-20th century; for example, the advent of nuclear weapons, the Cold War, and the possibility of surprise attacks on U.S. territory.

The War Powers Act was a product of three distinct short-term developments in American politics. First, the public's increasing dissatisfaction with the Vietnam War in the early 1970s was a leading contributing factor. Congressional leaders felt that they were misled by the president at the onset of the Gulf of Tonkin crisis and that the conflict, never declared by the Congress formally, was beyond Congress's ability to retract. A second factor contributing to the passage of the act was the overwhelming notion that the presidency had become "imperial" (in the words of Arthur M. Schlesinger Jr.) and was exceeding its constitutional mandate. Finally, the Nixon administration's involvement in the Watergate scandal placed the institution of the presidency in a uniquely weak and unpopular position relative to Congress. The confluence of these three factors created an environment in which the Congress sought to reclaim war-making powers from the presidency.

The matter of the constitutionality of the War Powers Act is contentious and unresolved. Congressional proponents argue that the Constitution gives Congress the power to limit presidential war powers by the Elastic Clause found in Article I, Section 8. Also, the Framers of the Constitution wrote "declaration of war" as way to include all armed conflicts. A common argument for the unconstitutionality of the act is that it violates the Separation of Powers principle; federal courts and the Supreme Court have weighed in on the issue, although they

have not considered any direct legal challenge to the law by a sitting president. In 1983, the Supreme Court ruled in *INS v. Chadha* that a legislative veto, meaning a congressional act that countermands a lawful presidential action, is unconstitutional. Subsequent administrations and critics of the War Powers Act have cited *INS v. Chadha* as a precedent that renders the act null and void.

Richard Nixon vetoed the War Powers Act precisely because he claimed that it was unconstitutional and that the ability to make war was implied under the designation of the president as the commander in chief of the armed forces (although it was not an explicitly enumerated power of the president pursuant to Article II of the Constitution). Congress passed the act over his veto, and the Nixon administration did not have an opportunity to challenge the law before the president resigned in 1974.

President Gerald R. Ford was the most compliant among the post-1973 presidents, partly due to his lack of popularity following his pardoning of Richard Nixon as well as Congress's assertiveness in many dimensions of federal policy making and administration. Ford, however, did have one opportunity to challenge the War Powers Act in 1975. After elements of the Cambodian Khmer Rouge hijacked the American freighter *Mayaguez*, Ford authorized the use of military force to reclaim the ship and its crew without consulting Congress. This military action was limited in duration and did not require congressional approval because it was less than 60 days long, but the president's hesitancy to inform Congress of his intentions prior to his deployment of the marines to Cambodia was a challenge to the act and set a precedent that all subsequent administrations would follow.

Ronald Reagan's administration was perhaps the most vocal critic and strongest challenger of the War Powers Act. Reagan irked the Democratic congressional leadership by notifying them of the 1983 invasion of Grenada after the fact; they had been unaware of the urgency of the crisis and did not know of the president's actions before the public knew. Three years later, Reagan would again use force without consulting Congress when he authorized air strikes against Libya. Ronald Reagan did more to nullify practical applications of the War Powers Act than any other president. By 1986, however, the tables were turned as Congress investigated alleged improprieties in Reagan's handling

of national security policy. The exposure of the Iran-Contra scandal and the critical report filed by the Tower Commission damaged the sitting president's approval rating and ability to pursue his foreign policy agenda during the latter half of his second term. Reagan's violations of the War Powers Act, however, were not addressed by Congress.

President George H. W. Bush deviated from Reagan's approach to war-making by seeking congressional consent for the Persian Gulf War in 1990. After the Iraqi invasion of Kuwait in August 1990, the Bush administration deployed a large contingent of American forces to Saudi Arabia for defensive and potentially coercive purposes and then asked for congressional approval to initiate an armed conflict with Iraq. What is remarkable about Bush's request to Congress is that, once granted, the administration claimed the War Powers Act to be unconstitutional and denied the necessity of congressional approval for the deployment of the armed forces to the Middle East and for the forceful liberation of Kuwait. The Bush administration maintained that the request was necessary due to the divisive nature of the war itself and the need to build a national consensus, not due to the obligations of the War Powers Act.

The Clinton administration continued the practice established by the preceding administration by seeking congressional approval for the use of military force while claiming that it was unnecessary for presidential action. Congressional skepticism regarding a potential U.S. invasion of Haiti in 1994 led it to pass a provision in an appropriations bill that required the president to seek congressional consent before any potential deployment. Although the Haitian crisis did not lead to an American invasion, the Clinton administration sent peacekeeping troops in the same year and notified Congress in a way that was compliant with the spirit of the congressional resolution. It was careful to note that it was acting in good faith and was not complying with the recent resolution or the War Powers Act. Overall, Clinton made a practice of seeking congressional approval while asserting the lack of necessity to do so during subsequent crises in the former Yugoslavia later in his administration. Congress did not take affirmative action against Clinton's possible violations of the act, thus further reducing its legitimacy.

George W. Bush faced the most grave national security crises of the United States in the post-Cold

War era and continued to assert that unilateral presidential war making was fully constitutional. After 9/11, the Bush administration did not seek Congressional approval to use military force to ensure homeland security. Considering the unexpected and urgent nature of the crisis, Congress acquiesced. Bush's pursuit of war against Iraq in 2002 and 2003, however, brought him to Capitol Hill to gain congressional approval. In October 2002, Congress passed a joint resolution that authorized the Bush administration to use force against Iraq at an unspecified date for the purposes of enforcing previous UN Security Council resolutions regarding Iraq. This action further eroded the likelihood that the act would have any bearing on a congressional reclamation of war powers.

President Barack Obama currently continues the tradition held by previous presidents by maintaining that the War Powers Act is unconstitutional. His administration pursued two wars in the Middle East inherited from the previous administration and made substantial efforts to consult Congress. Obama has not, however, explicitly complied with the act. One example of this behavior is seen in Obama's escalation of operations in Afghanistan in 2010, despite hesitancy and disapproval among the Democratic congressional leadership.

The issue of the War Powers Act resurfaced during congressional criticism of the Obama administration's handling of Operation Odyssey Dawn, the air campaign to support UN Security Council Resolution 1973 in the spring of 2011. In June, House Speaker John Boehner sent the president a letter asking for a legal explanation for not requesting congressional consent 60 days after the initial deployment. The Obama administration responded by claiming that the operation did not fall under the purview of the act because the campaign, which consisted of mostly strategic bombing and tactical air support, did not involve sustained fighting or put American troops at significant risk.

The War Powers Act is relevant to defense policy today in the sense that it resembles a desire by Congress to regain some of the war-making powers it retained prior to the mid-20th century. The reasons for the president's accumulation of those powers after 1945 are the same factors that influence the executive branch's ability to ignore elements of the act after 1973 and are likely to continue future presidents' noncompliance.

Furthermore, there are reasons to believe that rapid changes in the nature of war and international relations will make presidential compliance with the War Powers Act even less probable in future decades. These include the necessity of a quick decision-making environment and the prevalence of ambiguous and nonstate actors in current threat assessments.

Passage of the War Powers Act was a significant moment in presidential-congressional relations, but it has not fulfilled its potential to define them. The practice of presidential war making in the face of the act has weakened congressional ability and resolve to take further measures to reclaim war powers and highlights the preponderance of the chief executive in foreign affairs and national security matters.

WARFARE, AMPHIBIOUS

Amphibious warfare involves military operations that are launched from the sea by an amphibious force embarked in ships or craft. The primary purpose of these operations is the introduction of a landing force ashore. This landing force can be offensive, defensive, or humanitarian in nature. The ultimate goal of amphibious warfare is to contribute substantially to the attainment of those national strategic objectives that require the ability to project combat power onto a landmass from the sea. Modern major amphibious operations are complex

and require extensive specialized sea- and air-based logistical support. As such, they can be undertaken and sustained only by nations with well-developed land and sea combat capabilities.

Historical Background and Development of American Doctrine

Projecting combat power ashore has been a part of military and naval operations since antiquity. Some historical examples of landing operations include Greek landings against the Persians at Mycale in September 479 BCE; the Norman invasion of England in 1066; the Japanese invasion of Korea during the 16th century; the British and French attempts to land at Gallipoli in what is now Turkey between February and December 1915; numerous American landings in the South, Southwest, Central, and Western Pacific, 1942–1945; and the amphibious demonstrations and rehearsals leading up to the opening of the ground war in Operation Desert Storm in Iraq, in January and February 1991. Military leaders exercising overall command of both land and sea forces undertook the earliest of these actions. Dividing the command of the naval and landing forces between admirals and generals, respectively, an innovation introduced in modern times, created many planning and force coordination problems that proved very difficult to solve. One of the most significant aspects of the history of modern amphibious warfare, therefore, is how military leaders analyzed these problems and eventually overcame them.

Three nations, in particular, developed solutions for the problems associated with landing operations by the beginning of World War II. The British failed to maintain an amphibious capability during the 1920s and 1930s. This failure was due to several reasons. First, they were stung by their failure at Gallipoli. Second, they viewed amphibious operations to be of doubtful importance in any war that could be foreseen. Third, they were financially hamstrung during the interwar period. The impetus of World War II finally made them look at landing operations seriously in 1940. By that time, however, they were far behind both the Japanese and the Americans and had to play rapid catch-up. The doctrine they developed placed great emphasis on surprise, landing troops where the enemy's defenses were weakest or, preferably, nonexistent.

The Japanese, on the other hand, viewed amphibious landing capability to be of the utmost importance, especially in a war with the United States. Such a war seemed more and more inevitable as the years passed. To prepare for it, they developed during the 1920s and 1930s a doctrine of amphibious assault that emphasized landing troops in the teeth of an enemy's defenses. The Japanese army took the lead in developing this doctrine. The Imperial Navy contributed to the development of naval gunfire support, the movement of troops from ships to the shore, and other areas of a purely naval nature, but it was the army that dominated the process.

The United States, like Japan, undertook during the interwar period the development of a doctrine for moving troops ashore against determined opposition. Unlike Japan, however, the two American sea services, the U.S. Navy and the Marine Corps, were principally responsible for this development. In 1934, the Marine Corps Schools (MCS) were given the task of writing doctrine for the type of war envisioned by War Plan Orange, the American plan for a war against Japan. The Americans decided to study closely the British and French failure in the Dardanelles. The problem at Gallipoli, to their minds, was not in the concept of assaulting a defended beach but in the lack on the part of the British and French of a doctrine for doing so. Taking action based on this conclusion, the Marine Corps Schools stopped holding classes for several weeks beginning in November 1933 to develop a set of effective guidelines.

The instructors and students of MCS eventually completed the *Tentative Landing Operations Manual* in 1935. The navy adopted the manual 3 years later, retitling it *Fleet Training Publication [FTP] 167: Landing Operations Doctrine, U.S. Navy 1938* and giving it wide distribution within both of the sea services. This document, with modifications, provided the foundation for navy and Marine Corps amphibious operations from the landings at Guadalcanal in August 1942 to those at Okinawa in April 1945. It broke landing operations down into six components:

1. Command relations within the amphibious task force
2. Naval gunfire support of landings
3. Air support of landings
4. The movement of troops from transport ships to the shore
5. The securing of the beachhead once the troops had landed
6. The logistical support of the operation

At the heart of this doctrine was an emphasis on meticulous planning and diligent training.

The U.S. Army adopted *FTP 167* in 1941, putting it in army covers and retitling it *Field Manual 31-5: Landing Operations on Hostile Shores*. In Europe, Dwight D. Eisenhower oversaw an amalgamation of British and American doctrine, ultimately producing the plan for the invasion of Normandy in June 1944. This plan, relative to *FTP 167*, placed too much emphasis on air support and did not allow for enough naval gunfire support of the landings. In the Southwest Pacific, because of the size of many of the islands in that area, Douglas MacArthur did not have to land troops in the teeth of Japanese defenses as often as was necessary in the Central Pacific. Also, landings in the Southwest Pacific had to take place within range of Japanese land-based air power, a situation that was very dangerous for the supporting naval assets. MacArthur's amphibious commanders, therefore, developed a doctrine that emphasized putting troops ashore quickly where the Japanese were weak or not present and then withdrawing the majority of supporting ships from the area. The best examples of these types of landings were the operations undertaken as MacArthur's forces made their way along the northern coast of New Guinea from January 1943 until December 1944.

The U.S. Army's modifications in Europe and the Southwest Pacific of the basic doctrine contained in *FTP 167*, it has been argued, constituted the creation of two additional doctrinal traditions. The basis for all three, however, was the sixfold division of landing operations that had been developed during the 1930s. Lessons learned during World War II were incorporated into this basic doctrine, the one promulgated as *FTP 167*, and the improved version provided guidance for U.S. landings at Inchon in September 1950, Lebanon in July 1958, Da Nang in March 1965, and all along the coast of South Vietnam during the balance of the Vietnam War. By the late 1970s, however, weapons technology had developed to the point where the landing of troops in the teeth of an enemy's defenses seemed problematic at best. The British experience in the Falklands in 1982 showed just how lethal some of these new weapons could be. A new doctrine was called for.

American assault troops in a landing craft huddle behind the protective front of the craft as it nears a beachhead on the northern coast of France. Smoke in the background is naval gunfire supporting the landing (June 6, 1944).

Modern American Doctrine

The two most significant modifications of the old doctrine occurred during the 1990s and early 2000s. They are evidence of the growing importance of littoral operations in the minds of American naval planners after the end of the Cold War. The littoral is the area from the open ocean to the shore as well as the area inland from the shore that can be supported and defended directly from the sea. The conflicts of the post-Cold War world appeared to require a different naval emphasis than did the Blue Water world of the United States versus the USSR, and thinking had to evolve accordingly.

The first modification was introduced in three U.S. Navy and Marine Corps publications: *From the Sea, Forward . . . From the Sea*, and *Operational Maneuver From the Sea* (OMFTS). The most substantial change presented in these publications was the idea that establishing a beachhead was unnecessary. The power to move the landing force beyond the shore would be developed from the transporting ships themselves. The troops did not have to collect supplies and gather strength on a beach in order to then proceed inland. Movement from ships to points of enemy strength beyond the shore would be seamless, rapid, and violent. Also, the transporting

The build-up of Omaha Beach: Reinforcements of men and equipment moving inland.

Source: U.S. Army Center of Military History.

ships would launch the operation from over the horizon, staying as far away from an enemy's defensive guns and missiles as possible. New technologies such as the Landing Craft, Air Cushion, and the V-22 Osprey would allow this doctrine to be implemented. The second significant modification of the 1940s-era doctrine was the incorporation of amphibious capability within the concept of joint operations. This recasting of amphibious warfare doctrine is promulgated in *Joint Publication 3-02: Joint Doctrine for Amphibious Operations*. One can still discern remnants of *FTP 167* in the new document, but the level of services integration called for in *JP 3-02* stands in marked contrast to that foreseen

and allowed for in 1938, as does *JP 3-02*'s emphasis on nonmilitary uses of amphibious assets.

The doctrine put forward in *JP 3-02* can be described succinctly. The principal phases of an amphibious operation are planning, embarkation, rehearsal, movement, and action. The purpose of an amphibious operation will vary depending on the mission that it must accomplish. It can be used to strike swiftly at an enemy's critical vulnerabilities and decisive points, thereby defeating operational and tactical centers of gravity and achieving overall campaign objectives on its own. It can also be used as the first phase of a campaign or major operation, establishing a military lodgment ashore that can then

serve to support further action against an enemy. Amphibious forces can also be used to deny the use of an area or of particular facilities to an enemy or to divert enemy attention from the main effort of a campaign. Finally, amphibious forces can be used to support Military Operations Other Than War in order to accomplish such missions as the deterrence of war, the resolution of conflict, the promotion of peace and stability, or the support of civil authorities during severe domestic crises.

The new doctrine recognizes four key characteristics of modern amphibious operations. First, there must be a close integration between the navy and the landing force. Second, combat power must be rapidly built up from the sea to the shore. This characteristic takes into account the concept of operational maneuver from the sea. Third, amphibious forces must be organized according to the mission to be carried out. Organizational decisions must be made early on. No time can be wasted once an amphibious task force arrives at the point of insertion. Fourth, there must be an exceptional degree of unity of effort and operational coherence. The highly complex nature of amphibious operations and the extreme vulnerability of the forces engaged in putting a landing force ashore call for rapid deployment and rapid exploitation. Everyone must work together to complete the mission with dispatch. The result of this combination of key characteristics is rapid movement ashore with enough combat power to maintain the speed of operations well inland.

Though there have been numerous examples of landings from the sea since World War II, no nation has been involved in a conflict that has required the full implementation of amphibious warfare doctrine since the Korean War of 1950–1953. The United States used the threat of a full-scale amphibious landing during the 1991 Persian Gulf War to distract and confuse Saddam Hussein's commanders in Kuwait and Iraq, but that landing did not occur, and U.S. Marines were used in that conflict, as well as in the wars in Afghanistan and Iraq that began in 2003, as ground rather than amphibious troops. It has been in the area of Military Operations Other Than War that amphibious forces have been most active in the post–Cold War world. The United States, in particular, has been heavily involved in these type operations. U.S. naval and amphibious assets were used to provide relief in the aftermath of catastrophes

such as the 2004 Indian Ocean tsunami, Hurricane Katrina in 2005, and the 2010 earthquake in Haiti.

Conclusion

In a word, modern amphibious warfare equipment and techniques are adaptable. The present American doctrine allows for both military and nonmilitary uses of amphibious assets. An amphibious task force can be used either to attack an enemy or to support a friend in time of dire need. Modern weapons of war make the types of landings undertaken during World War II unlikely in the future, but the development of amphibious operations is not limited by their connections to the past.

WARFARE, BIOLOGICAL

The classic definition of biological warfare is the deliberate employment of disease agents to inflict casualties among military and/or civilian human populations, animals used for food or transport, or food crops. Because of the randomness and relative efficacy of some diseases, such as smallpox or anthrax, biological warfare has acquired a sinister reputation as a weapon of mass destruction. It is worth considering, however, that biological warfare may also encompass the use of disease-carrying insect or animal vectors as the means by which to spread disease. Likewise the use of specific refined natural toxins—for example, paralyzing agents such as curare or botulinum toxin, or life-threatening toxins such as ricin, derived from castor beans—may be rightly considered forms of biological warfare.

Biowarfare From Antiquity to the Early Modern

Since the first cities appeared in human history, sometime around 3000 BCE, the threat of infectious disease was real. Human settlements—especially walled cities and towns—created breeding grounds for a variety of diseases, many of them cross-species infections acquired through close interaction with newly domesticated animals. Three key developments grew out of the new urban environment. First, the acquired immunity of a population to disease. Prolonged exposure to even the most chronic infections conveyed advantage as communities built up resistance to debilitating or even lethal diseases. This also translated into a distinct military advantage in ancient warfare, when disease could be leveraged as a force multiplier by a community against its enemy. As communities recognized disease as an external influence that brought on misery and despair, if not outright death, infected animal and human carcasses themselves were used as weapons, either to poison wells or as projectiles intended to spread disease within a walled city. If the targeted community had little recent exposure to the specific disease, all the better, as it would be more virulent. Ancient texts describe how a mysterious animal plague accompanied Hittite armies throughout the Fertile Crescent. Recent investigations by historians and microbiologists have linked these reports to

tularemia, or “rabbit fever”—a deadly cross-species disease with a high (15%) mortality rate among humans. Accordingly, rather than attack cities outright, Hittite armies would leave infected rams and sheep behind for the targeted city. After bringing the diseased animals within their walls, an outbreak of “Hittite fever” would soon appear, weakening the defenders and making their conquest easier.

Biological warfare in the ancient world was not limited to the ballistic use of diseased carcasses and animals. In her study of the ancient world’s attitude toward biological weapons, Adrienne Mayor points out that Greek and Roman myths and histories are filled with accounts of their use. Between mythic representations and actual accounts portraying the deliberate use of disease and organic poisons by the Scythians, Persians, Greeks, and Romans, one can only conclude that the ancients shared a perspective on the morality of such agents far removed from the current day’s recalcitrance.

Limited and random use during the Middle Ages (1100–1450) and early Modern Era (1450–1700) outside of the New World offers a mixed perspective on the intentions and utility of biological warfare. Crusader and Arab chronicles both describe the spoiling of wells and cisterns across Cilicia and Armenia, generally with animal carcasses, to deny water to the enemy. This deliberate poisoning of water supplies is the most commonly described activity that could be considered as a form of biological warfare. Other incidents that are less clear in their intention include the practice of catapulting dead bodies and animal carcasses into besieged towns and castles. Different chronicles and accounts offer different justifications for the practice, ranging from spreading fear and terror to deliberate attempts to introduce plague or other disease among the defending garrison. In either case, results were uneven; not every incident achieved its intended goal. More often than not, outbreaks did not occur, simply because the biological agent was not strong enough or was incapable of being transferred from dead tissue to living individuals on its own. This is not to rule out success, however. Several cases of an unidentified gastrointestinal infection—likely typhoid fever—being introduced by catapult loads of infected feces exist. And in the case of the bubonic plague, some historians do believe that the first pandemic to strike Europe in the 14th century can be traced back to the Mongol siege of the Genoese trade port of Caffa

along the Black Sea, where plague-ridden corpses were catapulted over the town's walls.

Biowarfare From the Age of Exploration to the Age of Revolutions

The 200 years following the discovery and settlement of the New World stand out as clear case studies of the efficacy of biological warfare. While unintended, the 1518 decimation of the Aztec and Inca peoples by smallpox guaranteed their conquest and subjugation by much smaller Spanish expeditions. Both cases were examples of misfortune and the negative implications of the so-called Columbian Exchange. There is no indication of Spanish forces deliberately introducing smallpox as a weapon; however, the Spanish were well acquainted with its effects and exploited every advantage produced by the outbreaks. Indeed, the impact of Old World diseases—not only smallpox, but also measles, diphtheria, whooping cough, and tuberculosis—exact a cruel toll throughout the New World, killing by some estimates no less than 90% of the pre-1490 population. Presented with such devastation, there is little wonder that Europeans enjoyed such success in their colonization efforts.

White Europeans also became victims of the force multiplying effect of disease in wartime. Insect vectored fevers like malaria and yellow fever were introduced into the Caribbean and Central America through the importation of African slaves. Within decades, both diseases were well established throughout the Caribbean, South and Central America, as well as gaining footholds in English and Spanish North America. The presence of these lethal fevers, combined with other factors, imbued the entire region with a reputation of being a “green hell,” a locale lush with vegetation and flora and fauna but also deadly to White Europeans who ventured there for prolonged periods. Nothing quite helped build this reputation like the 1762 Siege of Havana. Occurring at the tail of the Seven Years’ War, a combined British and American naval and infantry force—more than 30,000 strong—landed outside the Spanish provincial port capital at Havana to complete the conquest of Cuba proper. Over the next 2 months, the Spanish defenders—themselves much reduced by fever—waited for the effects of yellow fever and malaria to make themselves felt. Even though the Spanish garrison was compelled to

surrender the city, disease wracked the British and Colonial forces undertaking the siege, with nearly 5,000 dead from fever. The reputation of Havana, along with the daily toll of disease among Whites and Blacks alike in the Caribbean and Central America, limited military adventures in the area for nearly a century.

The most controversial incident relating to biological warfare centers on a 1763 exchange of letters between General Jeffrey Amherst and Colonel Henry Bouquet. Amherst wrote his subordinate on the eve of his leading a relief column to Fort Pitt in the midst of Pontiac’s Rebellion, asking if there were any means to introduce smallpox among the Indians there. Bouquet agreed, suggesting the use of smallpox-infected blankets—a tactic that had already been attempted at Fort Pitt on June 24. Amherst’s assent (“You will do well to inoculate the Indians by means of blankets, as well as every other method that can serve to extirpate this execrable race.”) has been taken as evidence of a policy of deliberate biological warfare on the part of the British. However, the actual incident involving a junior officer, Captain Simeon Ecuyer, took place before Amherst’s first letter to Bouquet on the subject. Bouquet never had the chance to carry out Amherst’s order, since between June 24 and his arrival in the area the Indians surrounding Fort Pitt had departed. Historians have since been divided on the effectiveness of Ecuyer’s action, split between those who felt the infected blankets served their purpose that winter and those who find no evidence to indicate success or failure. Nevertheless, Amherst’s initial inquiry survives as the first formal request to employ biological agents in wartime in English North America.

Biowarfare in the 19th Century

The issue of biological warfare receded during the 19th century. During the American Civil War, Confederate political and military leaders counted on fever to delay or confound Union offensives along the coastal periphery. Yet while medical officers on both sides of the conflict were concerned about the possible impact of infectious diseases, such as yellow fever, malaria, or cholera, they were fortunate to avoid the worse-case scenario of a full-blown outbreak during a campaign. Nevertheless, disease created a serious dilemma for Union and Confederate armies, as camp diseases such as typhoid and

dysentery vied with measles and influenza as the chief agent of mortality. No less problematic was the issue of staph infections, such as erysipelas or necrotizing fasciitis, and gas gangrene, all resulting from the treatment of combat-related injuries in filthy conditions. Yet despite the loss of more than 400,000 lives to disease in the Civil War, there is no indication of a deliberate employment of biological agents in the conflict.

Biowarfare and the World Wars

During the First World War, Germany dabbled with biological agents briefly, targeting livestock and horses in neutral countries from 1915 until the end of the war. These attempts at organic espionage were rather amateurish, however. In Romania, German agents tried to infect livestock and horses for sale to Russia with anthrax and glanders. Similar covert efforts were attempted in France, with little real effect, while secret attempts to infect animal feed in the United States by German agents were foiled, not by federal intervention but by bad luck. Attempts to bring live cultures into the United States via U-boat failed when the samples of glanders died en route. As early as 1914, German agents attempted to raise sufficient quantities of anthrax and glanders in a secret home laboratory in Maryland. Horses bound for France and England were inoculated by German agents in Baltimore, but the program was later abandoned when a cold snap killed off the bacterial cultures. During the interwar years, the issue of biological warfare was considered in Geneva, resulting in a 1925 protocol restricting their use. Research, development, and production were not covered in the ban, however, which was seen as allowing for defensive or retaliatory use.

Each of the major powers sought to harness biological agents during the Second World War to varying effect. Perhaps the least interested combatant was Nazi Germany. Despite the regime's avowed ideological position on eugenics and racial exceptionalism, it was remarkably reticent toward developing or employing biological weapons. No doubt the prior war's poor results played into this position, but the more influential reason was the Fuehrer's own principled aversion to biological weapons. Only after 1942, when news of the British program reached Germany, did Adolf Hitler authorize testing with a variety of agents. Responsibility for

these tests—which were intended to identify defensive measures against biological warfare for the German population—was distributed among several agencies, including the Reich Health Ministry, the *Heer*, and the SS. Several lethal agents, including bubonic plague, hepatitis A, anthrax, and malaria, were tested on concentration camp inmates through 1945. After the war, several participants, including Reichsgesundheitsfuhrer Kurt Blome, were spared the death penalty by cooperating with American and British biological warfare programs.

The Soviet Union's policy toward biological warfare was well established by the start of Operation Barbarossa in June 1941. During the 1930s, Joseph Stalin approved the creation of the Scientific Research Institute of Microbiology, a Red Army research facility dedicated to biological weapons, and continuing work begun by the Military Chemical Agency in the 1920s. During the Stalingrad campaign of 1942, the Soviet Red Army allegedly introduced tularemia, a highly infectious bacterial disease common among rodents and small livestock, against German forces. The chief evidence offered in support is the dramatic increase in cases among panzer and panzergrenadier forces, spiking at 100,000 cases for all of 1942, compared with 10,000 cases in 1941 and 1943. Additionally, the majority of the 1942 cases were pulmonary infections, an extremely rare form of the disease generally associated with aerosol distribution. British and American research into biological warfare was generally cooperative. In 1942, the British army initiated testing of delivery systems for distributing anthrax in Scotland, poisoning the testing area for the next 50 years. American research began in 1941, following reports of Japanese field use of biological weapons in China. Based at Fort Detrick, Maryland, the Army's Biological Warfare Committee conducted its work under the aegis of the Chemical Warfare Service. By 1944, the base was producing anthrax, brucellosis, and psittacosis in sufficient quantities for field testing; in the meantime, a delivery system—the SPD Mk. I bomb, a 4-pound hollow bomblet—was developed and given the green light for production. One million bomb canisters were ordered in 1944 (and were cancelled at the war's end). The actual use of biological agents at the end of the war is highly unlikely. During planning for the 1945 and 1946 assault landings on the Japanese Home Islands, the first use of both biological and chemical weapons was ruled out by planners

acting under the express direction of President Harry S. Truman. The World War II American development of biological weapons, therefore, appears to have been for use as a retaliatory weapon in the event of a Japanese escalation.

The issue of possible Japanese employment of biological weapons was taken seriously in 1945 largely because of their profligate use in their war with China (1937–1945). The Imperial Japanese Army used typhus, bubonic plague, and cholera regularly against Chinese military targets and civilian population centers. Indeed, in some cases, such as the 1941 attack on the city of Changteh, Japanese bioattacks backfired. On this occasion, more than 10,000 cases of cholera, and an additional 1,700 deaths, were reported among Japanese forces after the microbes were released over the city. The Imperial Japanese Army established the now infamous Unit 731 to develop and test biological weapons. Based in the Manchurian city of Harbin, the organization employed more than 3,000 scientific personnel. Shigella dysentery, cholera, and bubonic plague were tested on Chinese civilians and captured Allied military personnel, frequently culminating in vivisections to establish the diseases' effects on the body. Field trials were conducted on at least 12 cities, according to postwar testimony, including the use of "flea bombs"—canisters containing thousands of plague-infected fleas bred in Unit 731. Postwar justice for these actions was denied to the Chinese people and government, however. Many key personnel associated with Unit 731, including the organization's commanding officer from 1932 to 1942, Colonel Shiro Ishii, and his successor, Kitano Misaji, were co-opted by the Soviet and American militaries and provided information about their wartime research to their former enemies.

Biowarfare and the Cold War

North Korea and the People's Republic of China both accused UN forces of dropping bombs laden with disease-infected insects during 1952. The evidence presented in support of these claims is at best sketchy: the "bomb shards" were made of ceramic, a material used by the Japanese Unit 731, not the U.S. Army's Chemical Warfare Service. Likewise, the use of an insect vector is a legacy of Japanese biowar protocol; in the late 1940s and early 1950s, American biological warfare was focused on

aerosol dispersal of brucellosis. Efforts to weaponize anthrax were still under way at Fort Detrick in 1951. The wartime (and post-Cold War) claims were further debunked by the release of Soviet documents indicating the false nature of all charges levied against the United States. Charges of biowar again were levied during the Vietnam War, this time by both sides. Americans decried the rudimentary use of feces-covered bamboo stakes ("punji sticks") by the National Liberation Forces in South Vietnam. The purpose of the stakes was to incapacitate unsuspecting soldiers and thus overwhelm the American medical support network with the ensuing infection cases. Meanwhile the American use of chemical defoliants was linked to purported use of fungal or microbial agents targeting livestock and agriculture in the region. Ironically, these charges were made during the period when the American biological warfare effort was de-escalating and redirecting its attention toward defensive measures.

During the Cold War, weaponized biological agents continued to attract secret support in the United States and the Soviet Union. The American effort was disseminated from Fort Detrick to bases and facilities across the country, including Pine Bluff Arsenal, Arkansas; Plum Island, New York; and Dugway Proving Grounds, Utah. The most favored American agent was anthrax, though testing was conducted on a number of other diseases. In 1959, for example, Fort Detrick undertook a crash program in breeding *Aedes aegypti* mosquitoes—the chief vector for yellow fever—after successful testing on the viability of the disease as a combined lethal/incapacitating agent. By the year's end, millions of mosquitoes were ready for use if called on. Other, more conventional, delivery systems were developed as well, including specialized warheads for 155-millimeter howitzers, Honest John rocket systems, and aerial delivery canister bombs. Many of these devices were tested at the Dugway Proving Grounds. These tests were in turn linked to covert scientific tests of airborne particle distribution, disease communicability in urban environments, and the role of interstate commerce and travel in disease distribution. News reports about these projects, combined with public unease over the Vietnam War and the public spectacle of dead livestock following a flawed nerve agent test in March 1968 at Dugway Proving Grounds, all contributed to the Nixon administration's decision to abandon

offensive biological weapons testing, development, and stockpiling in 1969. Three years later, the United States signed the United Nations Convention on the Prohibition of the Development, Production, and Stockpiling of Bacteriological and Toxic Weapons and on their Destruction. All operations at Fort Detrick were redirected to the U.S. Army Medical Research Institute for Infectious Diseases (USAMRIID), where unclassified research on biological warfare and national response policy continues.

The Soviet Union embraced a vigorous biological warfare program during the Cold War, one that, if former participants are to be taken at face value, far surpassed that of the United States in scope and output. Soviet researchers pursued many of the same disease agents that interested American specialists: Anthrax, brucellosis, and tularemia in particular were weaponized in the 1950s and 1960s. Unlike the American program, however, the Soviet Union continued to pursue offensive biological warfare research after signing the 1972 UN Convention. Under the new *Biopreparat* organization, the different Soviet research programs were united under a single institutional framework, greatly increasing efficiency and production output. New emphasis was placed on delivery systems and new biological agents, including ebola and smallpox; while new variants on existing diseases were pursued through recombinant DNA research. Even the accidental release of anthrax in a 1972 explosion at a Sverdlovsk production plant did not slow research or production. The 1991 collapse of the Soviet Union not only stalled the entire biological warfare program, it created a new set of problems with the collapse of the secrecy and security networks that protected the *Biopreparat* from the outside world. The overall safety of former Soviet test sites and production and storage facilities remains a concern, as such sites, the personnel employed there, and the special knowledge they hold are ripe targets for international criminals and terrorist organizations.

Biowarfare in Afghanistan and Iraq

Between the 1979 Soviet invasion of Afghanistan and the 2003 American invasion of Iraq, the Middle East and Central Asia have been saddled with the unenviable distinction of being at the center of recent claims regarding biological warfare. In 1982, the Central Intelligence Agency observed a

poisonous “yellow rain” in Laos and Afghanistan that poisoned plants, animals, and people who came into contact with it. Accordingly, physical samples of residue collected from sites in Southeast and Central Asia indicated the presence of tricothecene (T-2) mycotoxin. Eyewitness accounts all described a fly-over by a low-level helicopter or fixed-wing aircraft, from which a “yellow rain-like material” was sprayed over crops and villages. While some alleged victims were reported to have died after coming into contact with the mysterious substance, more often than not individuals suffered from bouts of abdominal pain, without the hemorrhaging associated with mycotoxin poisoning. The lack of hard evidence outside of the collected samples and the odd Soviet chemical warfare filter impregnated with mycotoxin spores, and the more prevalent use of chemical agents by Soviet forces and their clients in Laos, Kampuchea, and Afghanistan created enough reasonable doubt to put the claims into question. The reports were further compromised when biologists linked the “yellow rain” to bee excrement; experiments and observations indicated that bee colonies in flight would excrete waste to cool off.

The most cited case of misinformation and poor intelligence regarding biological weapons and other weapons of mass destruction is the pre-2003 campaign to uncover proof of Iraqi malfeasance by the administration of the U.S. president George W. Bush. While the administration’s claims of an existing program proved baseless, there was a historical precedent of an Iraqi biowarfare program. During the 1980–1988, Iran-Iraq War, the Iraqi leader Saddam Hussein’s regime attempted to weaponize anthrax and botulinum cultures as a last-ditch weapon in the event of any Iranian breakthrough. As early as 1981, the Iraqis entered into contracts with German and French firms to acquire equipment that would facilitate the large-scale manufacture of weaponized botulinum and mycotoxin. By 1995, Iraqi production facilities were making large quantities of more than 17 different biological agents, including anthrax, botulinum, gas gangrene, T-2 mycotoxin, and aflatoxin, a highly carcinogenic form of mycotoxin that targeted the liver, causing massive hepatic necrosis. The greatest challenge to the Iraqis was the lack of a reliable delivery system. Only at the end of the war did the Iraqi military settle on artillery shells as the primary delivery vehicle, followed by

al'Hussein ballistic missiles (modified Soviet SS-1 Scud tactical ballistic missiles).

Peace came before the Iraqis could introduce their biological weapons, however. At the onset of the 1991 UN-authorized coalition attacks against Iraq in response to its invasion of Kuwait, the possibility of an Iraqi biochemical first strike was taken seriously enough to compel the widespread distribution and use of protective gear and protocol by coalition forces. Meanwhile, more than 150,000 doses of anthrax antitoxin and 8,000 doses of a new experimental botulinum toxin were given to American forces. Despite reports of a medical reaction to the vaccines, the Department of Defense considered the prophylactic vaccination program a success—even though no biological or chemical weapons were employed by Iraqi forces. This nonuse has been linked to several factors, most notably the realization on Hussein's part that they would trigger massive retaliation. Regardless, postinvasion inspections identified stockpiles for destruction, including more than 175 artillery shells and al'Hussein warheads that had the potential to deliver biological weapons.

Between the 1990s and 2003, there were reports about Iraq's purported use of biological and chemical agents against Kurd and Shi'a communities. Unsubstantiated reports of biological weapons use alongside actual chemical weapons use fueled suspicions of an ongoing biological warfare research program throughout the 1990s. These rumors were seized on by the administration of President George W. Bush to justify the 2003 invasion of Iraq. Curiously, the Hussein regime did nothing to refute American claims in the year leading up to war, leading some to conclude that Baathist Iraq embraced the rumors as a deterrent to Iranian influence in the region. If so, then deterrence came at a terrible price for Saddam Hussein and his regime, as the alleged biological warfare research constituted the Bush administration's primary justification for invasion, along with claims of nuclear weapons research that also were unsubstantiated. As events subsequently proved after 2003, there was no biological warfare program in Iraq, nor had there been since the early 1990s.

Bioterror

The post-Cold War advent of nongovernmental actors motivated by extremist ideologies—be they nihilist, racist, or religious in context—has coincided

with a growing sense of dread at the prospect of a biological terror attack. Indeed biological toxins and microbial agents offer tremendous potential as a leveling factor for any committed group. Unlike nuclear weapons programs, which require massive commitments of national wealth and policy, biological weapons may be obtained cheaply by any individual or organization with access to money and talent. Indeed, since the September 11, 2001, terrorist attacks, the prospect of their use by any committed nongovernmental organization has given rise to a new term—*bioterror*—in the security lexicon. If one were to consider the use of poisons and drugs, it is possible to trace bioterror as a method of war or politics back to the ancient world. Indeed, some of the incidents discussed in the opening of this entry are equally deserving of being labeled as terror acts as much as organized warfare. For the purpose of this entry, however, the focus on bioterror will be limited to post-1972 activities conducted by nongovernmental organizations or individual actors with the purpose of introducing fear in the general population to compel submission or compliance.

Early attempts at developing biological agents for the purpose of spreading fear date back to the 1970s. In 1972, during the cultural tumult surrounding the waning Vietnam War, two college students were arrested for planning to introduce live typhoid cultures into the Chicago water supply. While on bail, the two fled the United States, leaving their plan unfulfilled. In 1984, a more successful use of biological agents against an unwitting civilian population was conducted by the followers of Bhagwan Shree Rajneesh in rural Oregon. In the face of local resistance to the cult's growing influence in and around The Dalles, Oregon, area, fanatical members sprayed a salmonella-laced solution on salad bars in area restaurants. The attack was not lethal, though more than 750 persons were sickened. A joint investigation by the state of Oregon, the Centers for Disease Control (now the Centers for Disease Control and Prevention), and the Federal Bureau of Investigation discovered evidence linking the Bhagwan's followers directly to the outbreak. In the end, two followers were indicted and pled no contest to charges associated with the plot; the Bhagwan himself was never charged for the crime, though he was fined and deported for immigration violations.

On March 20, 1995, several canisters of liquid sarin gas were released in a coordinated attack on

the Tokyo metro system. Twelve persons died and more than a thousand were injured by the attack. Subsequent raids on *Aum Shinrikyo* properties revealed a home-made arsenal of sarin nerve gas and crudely weaponized anthrax and ebola cultures. Over the next month, a wave of murders targeting police leaders and former cult members swept across Japan until Shoko Asahara's arrest on May 16, 1995.

Anthrax

In the weeks after September 11, 2001, a series of letters containing weaponized anthrax were mailed from post offices across suburban New Jersey to news organizations and the offices of Senators Tom

Daschle and Patrick Leahy. Twenty-two persons came down with anthrax, five of whom died. The anthrax culture itself proved to be a highly refined strain of the disease, known as the Ames Strain (for where it was first discovered in 1981 at Ames, Iowa). It was widely reported at the time that the medium was given a silicon coating to maximize its effectiveness as a lethal agent, a claim that was later disproven. After identifying Steven Hatfill, a researcher at Science Applications International Corporation, as a "person of interest" in the crime, the Federal Bureau of Investigation finally settled on Bruce Ivins, a senior researcher at the USAMRIID, as the primary suspect in 2008. Ivins committed suicide before his arrest, leaving behind claims supported by evidence but no conviction to close the

case. Regardless of the outcome, the anthrax attacks continue to linger in the public's memory both for the terror they fostered and for the appropriation of the method by mailing threats laced with harmless "white powder" that was mistakenly taken as anthrax.

Biowarfare in the Current Day

Despite the 1969 convention's strictures, many industrial and developing nations continue to maintain biological warfare research programs. Often, countries state that all research is done for defensive reasons, which appears to be true in some instances. However, roughly a dozen nations are believed to have pursued or maintain an offensive capability with regard to biological weapons (BW). These nations include Algeria, Russia, the People's Republic of China, Cuba, Syria, Taiwan, India, Israel, Pakistan, North Korea, and Iran. Other programs may exist, as a 2005 Congressional Research Service report noted, "Because much of the material and equipment used to produce BW has legitimate medical, agricultural, or industrial purposes, and because BW could be produced covertly in a relatively small facility, other countries or groups may have undetected BW programs."

For its part, the United States continues to perform defensive research with regard to biological warfare. As a signatory to the 1969 convention, the United States destroyed its stockpile of biological weapons by 1975. Small cultures of lethal diseases, including anthrax, bubonic plague, ebola, and smallpox, are believed to be held in cold storage at undisclosed locations associated with the USAMRIID. According to USAMRIID, all American research centers on countermeasures and detection.

Conclusion

The invasion of Iraq and the 2001 anthrax episode highlight how the prospect of biological warfare has replaced nuclear war as the chief fear among numerous Western security and defense analysts. And as it turns out, research and production are still less essential for the potential terror actor than one might think, as the former Soviet Union's stockpiles and knowledge base remain under light supervision, if any at all. And as recent fictional accounts highlight, many analysts believe that the best delivery system is not a missile or a bomb but a single infected person

with the sniffles on an international commuter flight. This is the "nightmare scenario" cited by Centers for Disease Control, U.S. Army Medical Department, and World Health Organization experts—the deliberate infection of several persons with a high morbidity/high mortality disease, who subsequently enter the public sphere with the intention of spreading the disease as randomly as possible. Exacerbating this is the poor state of public health readiness for major disease outbreaks. The world is well equipped with research teams in the form of the World Health Organization and individual national organizations such as the U.S. Centers for Disease Control and Prevention. There is no question that a terror-related outbreak would be readily identified and research into a response would be vigorous. The weak link lies in direct prevention, isolation and quarantine enforcement, and immediate patient care. There are also questions about whether government services would continue to function and public order would be maintained in the face of a human-made outbreak. In the end, what makes biological weapons so effective is not their direct ability to infect a population. It is the fear and chaos they unleash among a society at risk that makes biological warfare and terror attacks so effective. The best prevention, therefore, may lie not in identifying the threat before it strikes but in bolstering civic infrastructures so that society itself may survive it.

WARFARE, ELECTRONIC

Electronic warfare is the employment of the electromagnetic spectrum for defensive and offensive military purposes. Electronic warfare is practiced by ground, sea, and air forces. It consists of three main subdivisions: (1) electronic attack, (2) electronic protection, and (3) electronic warfare support.

Electronic Attack

Electronic attack employs directed energy weapons to attack military and civilian equipment and installations. Directed energy weapons use electromagnetic and laser radiation.

Electromagnetic-Directed Energy Weapons

Electromagnetic radiation is employed to directly attack electronic circuitry. The use of electromagnetic radiation for this purpose exploits a scientific phenomenon known as the electromagnetic pulse (EMP).

The EMP was observed as an effect resulting from the first detonation of an atomic weapon during the Trinity test by the United States on July 16, 1945. The EMP had been anticipated, and was observed, by the Italian American physicist Enrico Fermi who, along with the physicist Julius Robert Oppenheimer, was a leading member of the wartime Manhattan Project to develop atomic weapons. The Trinity test was a key part of the Manhattan Project.

During an atomic explosion, gamma radiation ionizes the atmosphere, and it can also create similar damage in electronic circuits to the effect of those circuits being struck by lightning. During the Cold War, the military potential of harnessing the EMP to destroy electronic circuitry in military and civilian equipment, such as radar, radios, aircraft avionics, and telephone communications, was recognized; although the EMP can affect any equipment possessing electronic circuitry. Some resistance to EMP effects is possible through the employment of a technique known as hardening. Hardening physically shields circuits with special materials to act as a barrier against EMP radiation, or via software programming to enable electronic equipment to detect and correct data processed by its circuits that may have been corrupted by EMP radiation.

The combat potential of the employment of the EMP has been noted by several military practitioners. Lieutenant Colonel Thomas C. Riddle of the U.S. Army stated that the detonation of a nuclear weapon at an altitude of 269 nautical miles (500 kilometers) above the continental United States could have the effect of causing serious disruption to unshielded electronic circuits and electronic equipment in the United States and parts of Canada and Mexico. Riddle's assertion underlines the electronically destructive effect of such a detonation when

one considers the sheer quantity of civilian critical infrastructure dependent on computer systems for their functioning, such as power stations, hospitals, public transport networks, telephone systems, broadcasting, emergency service first responders, public health systems, and food supply chains.

Although the chief method by which an EMP could be created during the Cold War was by an atomic or nuclear explosion, contemporary electronic systems can be disrupted by high-power radio frequency (HPRF) weapons. HPRF weapons employ microwaves to disable and destroy unshielded electronic systems. Research is ongoing in the development of such weaponry. In 2010, the U.S. Air Force awarded a contract to the defense contractor Lockheed Martin to explore the development of a weapon that can cause effects similar to the EMP but without requiring a nuclear or atomic explosion as part of the air force's Non-Kinetic Counter Electronics Capability initiative.

The rationale of the Non-Kinetic Counter Electronics Capability program is to develop an HPRF weapon that can be carried by an aircraft and used to attack targets such as enemy radar systems. Any HPRF weapon developed as a result of the Non-Kinetic Counter Electronics Capability program would lack the effective range of an atomic- or nuclear-explosion-induced EMP as it would not have the equivalent energy of such a detonation. Nevertheless, the HPRF's relative lack of power could provide it with the advantage of precision, as it may be possible to direct the HPRF's emitted microwave energy in such a fashion as to disable the circuitry of a military radar but leave nearby civilian critical infrastructure unaffected.

Laser-Directed Energy Weapons

Electronic attack also encompasses the use of laser radiation weapons. Laser radiation produces intense heat when applied to particular materials, hence its use for cutting cloth, engraving, and welding. When employed as a directed energy weapon, these characteristics are employed to damage and destroy military equipment.

Laser radiation has been utilized for ballistic missile defense applications, notably as part of the U.S. Air Force's Airborne Laser Program. The Airborne Laser Program used a Boeing 747 aircraft equipped with a chemical oxygen iodine laser designed to

destroy tactical ballistic missiles during the boost phase directly after launch before the missile reaches an altitude of around 650,000 feet (200,000 meters). The airborne laser would destroy ballistic missiles by initially detecting these weapons and calculating the missiles' trajectory and speed using a low-powered laser fired from the aircraft. Laser light reflected from the missile would allow the airborne laser's integral fire control system to calculate the missile's position in the sky. These coordinates would then be used to provide an aiming point for the aircraft's main chemical oxygen iodine laser.

The main laser is then fired at the missile for between 3 and 5 seconds. It heats a particular point on the missile that progressively weakens its structure until the missile's airframe fails, causing a catastrophic loss of control. Although the prototype airborne laser was used to destroy simulated missile targets in a number of tests, the U.S. Department of Defense formally cancelled the program in December 2011.

Electronic Protection

Alongside electronic attack, the second major branch of electronic warfare is electronic protection. Electronic protection exploits the electromagnetic spectrum to safeguard aircraft, ships, and ground vehicles from detection and attack. Electronic protection uses both active and passive techniques.

Active Electronic Protection

Active electronic protection utilizes the electromagnetic spectrum to attack radar and radar-guided weapons. Active electronic protection systems emit either electronic or physical countermeasures to render radar and radar-guided weapons inoperable.

Active electronic protection systems have many different designs. Systems designed to render radar or radar-guided weapons inoperable are typically carried by combat aircraft and warships. One example of a radar-active electronic protection system is the AN/ALQ-99 electronic warfare equipment, which outfits U.S. Navy and U.S. Marine Corps combat aircraft. The AN/ALQ-99 monitors the electromagnetic spectrum for radar transmissions, analyzes these transmissions to determine their point of origin, and then transmits high-energy electronic signals designed to disrupt the radar's performance or to destroy it outright.

As noted above, active electronic protection systems can utilize physical countermeasures to render radar or radar-guided weapons inoperable. One such countermeasure is known colloquially as “chaff.” Chaff was developed by British and American scientists during the Second World War, and it remains in use today. Essentially, chaff is a generic term for any strips of aluminum, plastic, or glass fiber coated with a metallic surface. These strips are typically cut to exactly one half of the wavelength of the radar that they are intended to disrupt. For instance, when chaff was developed during the Second World War, aluminum strips were cut to a length of 27 centimeters. This was half the 54-cm wavelength used by the *Luftwaffe* (German air force) Würzburg fire control radar used for directing anti-aircraft guns firing at Royal Air Force and U.S. Army Air Forces bombers flying over Germany and occupied Europe.

The use of chaff is relatively straightforward. When the radar warning receiver on a ship or an aircraft detects that it has been illuminated by a radar, chaff is dispersed into the surrounding air. The chaff then blooms into a large cloud. Transmitted radar waves hit this cloud and are reflected back to the radar. Each piece of chaff creates its own radar reflection, with the effect that the radar operator's screen is soon filled with thousands of reflections. The aircraft or ship dispersing this chaff is then camouflaged within this image.

Passive Electronic Protection

While active electronic protection systems provide a mechanism by which a radar or radar-guided weapons can be rendered inoperable through the use of transmitted energy or the dispersal of physical countermeasures, passive electronic protection is used to alert an aircraft, a ship, or a vehicle that it has been targeted by a radar, laser, or missile.

This detecting is performed by electronic systems known as RWRs (radar-warning receivers), LWRs (laser-warning receivers), and MAWSs (missile approach warning systems). RWRs tend to be used by ships and aircraft to monitor the electromagnetic spectrum to detect radar transmissions. Once a transmission is detected, an RWR can alert a pilot or a ship's crew that they are being illuminated by a radar, the type of radar performing the illumination, and the radar's possible position. The RWR performs this task by comparing the radar

transmissions it detects with an internal library of known radar types and their transmission characteristics, while the use of direction-finding techniques determine the radar's position.

An LWR works in a fashion similar to an RWR, although LWRs often outfit ground vehicles as well as ships and aircraft. An LWR detects laser light and then alerts the personnel onboard a vehicle, an aircraft, or a ship that they are being targeted by a laser detection system or by a laser-guided weapon. Finally, missile approach warning systems tend to be used by aircraft, and utilize electromagnetic sensors to detect the heat plume of a missile launch, or a missile in flight. Alternatively, a missile approach warning system can also use radar to detect the missile launch or use a combination of these two systems. Once detected, the location and flight profile of the missile can be presented to the crew on a cockpit display.

One crucial difference between active and passive electronic protection is that military equipment in the former category primarily provides a warning that an aircraft, a ship, or a vehicle has been targeted by a radar along with countermeasures that can be employed against such threats. Passive electronic protection systems, on the other hand, do not typically include countermeasures.

Electronic Warfare Support

The final branch of electronic warfare is the application of electronic warfare support. Electronic warfare support primarily focuses on the gathering of electronic intelligence (ELINT) and communications intelligence (COMINT). The collection of ELINT and COMINT is achieved by monitoring the section of the electromagnetic spectrum used by radar and communications systems.

Electronic Intelligence

The collection of ELINT uses Electronic Support Measures (ESMs) to monitor the electromagnetic spectrum for radar activity and then to classify and locate any radar systems detected.

Military and civilian radar systems operate in a series of bands positioned between 1 and 40 gigahertz (GHz) in the electromagnetic spectrum. Similar to an RWR, an ESM will monitor this frequency range to detect radar systems and then classify the radar type and locate its position. While RWRs

arguably have a tactical mission, in that they are intended to provide an individual ship or an aircraft with protection, ESMs can be used to support higher levels of war.

Typically, ESMs are used to draft the “electronic order of battle” of an opponent: primarily the radar systems used by an adversary and where these radars are located. Such information will then allow military planners to devise air routes beyond the range of these radars to and from particular targets. Determining the physical location of a radar via the gathering of the electronic order of battle also allows military planners to nominate hostile radar for destruction using either active electronic protection systems or conventional weapons. At sea, the collection of the electronic order of battle allows a ship to determine which vessels in its vicinity may be hostile, friendly, or neutral based on the radar emissions of those ships.

Communications Intelligence

Much as ELINT collection focuses on the detection, classification, and location of radar emissions, the collection of COMINT fulfills a similar purpose regarding hostile military communications systems.

While radar operates in the 1 to 40 GHz part of the electromagnetic spectrum, military high frequency, very high frequency, and ultra high frequency communications operate across a frequency range of 3 megahertz (MHz) to 1 GHz. COMINT systems can monitor this part of the spectrum for communications traffic to ascertain whether such communications are encrypted, the location of communications transmitting equipment, the regularity of transmissions, hostile radio frequencies, and the recipients of particular transmissions.

When such information is obtained, it is then possible to draft a communications order of battle. This allows military planners to target an enemy’s communications network for attack with conventional weapons or via electronic attack to disrupt the network. The collection of COMINT is also an important part of the execution of psychological warfare as, once the communications order of battle is drafted, military planners are able to determine which parts of a hostile communications network can be targeted by misleading or false traffic and propaganda.

WARFARE, SUBMARINE

Contemporary submarine warfare involves the varied missions of intelligence, surveillance, and reconnaissance (ISR); peacetime engagement; special operations; battle space preparation; precision strike; sea denial; sea control; support of land battle; and strategic deterrence. Contemporary submarine warfare involves the application of multimission submarines with strengths in stealth, endurance, and firepower. There has been a notable shift in submarine warfare from its origins of open-ocean anti-surface warfare in World Wars I and II to strategic deterrence during the Cold War, and more recently to support land forces through the use of cruise missiles and deployment of Special Operations Forces (SOF). As mission requirements change in the future, undoubtedly submarine warfare will continue to transform as well. This entry details the types of submarines in use today, outlines a brief history of submarine warfare, describes the usage of submarines in contemporary conflicts, and discusses the direction of future development of submarine warfare both tactically and strategically.

Types of Submarines

There are three main types of submarines: attack submarines, fleet ballistic missile submarines, and guided missile submarines.

Attack Submarines

U.S. attack submarines are designated SSN, with SS standing for submarine or “submersible ship,” and N for nuclear. The primary functions of attack submarines are to destroy enemy submarines and surface ships, project power ashore through the use of cruise missiles and SOF personnel, conduct ISR, and engage in mine warfare. There are currently three classes of attack submarines in service with the U.S. Navy. The most common is the *Los Angeles* class (SSN 688). There are 43 *Los Angeles*-class submarines currently in service. The most advanced attack submarine is the *Seawolf* class (SSN 21). There are currently only three *Seawolf*-class submarines in service in the U.S. Navy. The third class of attack submarines is the *Virginia* class (SSN 774). Many U.S. Navy officials view the *Virginia* class as the next-generation attack submarine. The *Virginia* class is focused on successfully operating in the littorals, defined as the area on or near the seashore, and increasingly utilizing and supporting SOF personnel. The *Virginia*-class attack submarines are developed with modular construction, allowing for mission-specific tailoring as well as enhanced service life. Attack submarines utilize a broad array of weapons. They are armed with Tomahawk Land Attack Missiles (TLAMs), MK 48 heavyweight torpedoes, and MK 48 Advanced Capability heavyweight torpedoes. They also have the ability to deploy SOF personnel.

Fleet Ballistic Missile Submarines

The second type of submarine is the fleet ballistic missile submarine. Also known as Trident submarines or “boomers,” this type of submarine is designated SSBN. There is only one class of fleet ballistic missile submarine in service with the U.S. Navy—the *Ohio* class (SSBN 726). There are currently 14 *Ohio*-class submarines in service. Fleet ballistic missile submarines carry Trident II (D5) submarine-launched intercontinental ballistic missiles as well as MK 48 heavyweight torpedoes. Known as a submarine-launched ballistic missile, the Trident II (D5) missile is the backbone of the U.S. strategic deterrent arsenal. It has been deployed since 1990 and will continue to be deployed until at least 2020. The Trident II (D5) has a range of more than 4,000 nautical miles and carries a warhead composed of nuclear multiple independently targeted re-entry vehicles (MIRVs). These weapons are capable of

separating into several nuclear warheads, each with a distinct target. Fleet ballistic missile submarines are virtually invulnerable to retaliation due to their mobility, stealth, and endurance.

Guided Missile Submarine

The third type of submarine is the guided missile submarine. U.S. guided missile submarines are designated SSGN. Guided missile submarines are *Ohio*-class fleet ballistic missile submarines that have been converted from a strategic deterrence platform into a conventional land attack and SOF platform. There are currently four *Ohio*-class guided missile submarines in service. Instead of Trident II (D5) submarine-launched ballistic missiles, these *Ohio*-class guided missile submarines carry up to 154 Tomahawk or Tactical Tomahawk Land Attack Missiles in addition to their MK 48 heavyweight torpedoes. They can house up to 66 SOF personnel at a time and contain a swimmer lock-out shelter and Advanced SEAL Delivery System. More than 40 countries worldwide operate submarines, with the United States, Britain, France, Russia, and China operating strategic deterrent submarines as well.

History

The first American submarine was built in 1775 by David Bushnell. Named the *Turtle*, this vessel attempted three times during 1776 to break the British blockade of New York harbor by attaching a torpedo to the British ship HMS *Eagle*. All three attempts were unsuccessful. On July 3, 1801, Robert Fulton’s submarine the *Nautilus* conducted a 1-hour underwater dive at a depth of 25 feet. On February 17, 1864, the Confederate submarine *H. L. Hunley* became the first submarine to sink another vessel when it attacked the USS *Housatonic* in the waters off Charleston, South Carolina. The blast also sank the *H. L. Hunley*. On April 11, 1900, the U.S. Navy officially acquired a submarine force when it purchased the *Holland VI*, John P. Holland’s internal combustion gas-powered submarine. Shortly thereafter, on October 12, 1900, the U.S. Navy commissioned the USS *Holland* (SS 1), making it the first U.S. submarine.

On February 14, 1914, the USS *Skipjack* (SS 24) was commissioned. It was the first U.S. submarine to run on diesel engines. Two years later in 1916, it became the first U.S. submarine to cross the Atlantic Ocean under its own power. On June 19, 1916, the

U.S. Navy established the Submarine Force U.S. Atlantic Fleet, and on June 28, 1917, the U.S. Navy established the Submarine Force U.S. Pacific Fleet. During World War I, the German navy utilized unrestricted submarine warfare to prey on the weakness of surface vessels vis-à-vis submarines. During World War II, the U.S. Navy conducted a highly successful campaign against both Japanese navy and Japanese commercial shipping, severely crippling Japanese logistics. Submarines during World War II added the capability to conduct antisubmarine warfare as well. On January 27, 1942, the USS *Cudgeon* (SS 211) became the first U.S. submarine to sink another submarine when it sank the Japanese submarine IJN I-173.

Submarine warfare experienced a revolution during the 1950s. As a result, the primary focus of submarine warfare shifted to strategic deterrence. On September 30, 1954, the USS *Nautilus* (SSN 571) was commissioned. It was the first nuclear-powered submarine. Nuclear power fundamentally transformed both the capabilities and the missions of submarines. Nuclear submarines had far superior endurance because they rarely needed to surface to refuel. As a result, the endurance of nuclear submarines became limited only by the need of the crew for provisions. In December, 1959, the USS *George Washington* (SSBN 598) entered service. This event marked the transition of submarines to active use as a strategic deterrent.

The current submarine force first entered service in the 1970s. On November 13, 1976, the USS *Los Angeles* (SSN 688) was commissioned. It was followed by the USS *Ohio* (SSBN 726) on November 11, 1981. In the 1990s, submarine warfare began to shift again. Submarines took an active role in combat operations on land, primarily through precision strike. On January 19, 1991, the USS *Louisville* (SSN 724) became the first submarine to launch a TLAM against an enemy target in support of Operation Desert Storm. Submarine capabilities reached a new milestone in the late 1990s. On July 19, 1997, the USS *Seawolf* (SSN 21) was commissioned after a little more than a year of sea trials. It was the most advanced submarine ever built. However, the cost was also extremely high.

Contemporary Conflicts

The end of the Cold War fundamentally altered submarine warfare. The role of strategic deterrence

remained but in diminished form. More important, exclusively naval missions transformed to new joint roles, especially for attack submarines. As a result, submarines became directly involved in a number of contemporary regional conflicts. The two primary usages of submarines in contemporary conflicts have been ISR and precision strike. The stealth of the submarine allowed positioning prior to hostilities in order to conduct ISR. If hostilities erupted, then the submarine engaged in precision strike predominately in support of land battle. Importantly, precision strike was a new mission in submarine warfare.

Operation Desert Shield/Desert Storm in 1990–1991 was the first major conflict after the end of the Cold War. During this conflict, more than a dozen submarines were deployed to the area of operations in the Persian Gulf and surrounding waters primarily conducting surveillance. However, soon after the transition to combat operations, the submarines USS *Louisville* (SSN 724) and USS *Pittsburgh* (SSN 720) launched TLAMs against enemy targets within Iraq. Operation Desert Shield/Desert Storm heralded the introduction of smart weapons, capable of accuracy potentials previously unreached. Even so, the usage of submarines to conduct precision strikes was still nascent and unrefined.

By the end of the decade, the use of submarines to conduct precision strikes had been much refined. In 1998, submarines launched attacks against land targets in both Sudan and Afghanistan in response to the terrorist bombings of the U.S. embassies in Kenya and Tanzania. Later that same year, the USS *Columbus* (SSN 762) launched attacks against land targets in Iraq in support of Operation Desert Fox. By the spring of 1999, submarines had attacked key targets in Kosovo in all weather conditions in support of Operation Allied Force.

Following the terrorist attacks on America on September 11, 2001, the usage of submarines in contemporary conflicts focused heavily on ISR and precision strike. When Operation Enduring Freedom began on October 7, 2001, with attacks into Afghanistan, the USS *Providence* (SSN 719) was primarily a precision strike platform. Beginning on March 19, 2003, Operation Iraqi Freedom illustrated the significant transformation of submarine warfare in the contemporary period to precision strike. Whereas in Operation Desert Shield/Desert Storm, only a fraction of the submarines in the area of operations conducted precision strikes,

accounting for less than 5% of the total TLAMs fired, in Operation Iraqi Freedom, all 12 submarines in the area of operations launched TLAMs, accounting for roughly a third of all TLAMs fired. Accuracy rates also improved dramatically. The related missions of ISR and precision strike had become a staple usage of submarines in contemporary conflicts.

Future Development

Twenty-first-century submarine warfare will increasingly focus on battle space preparation, command of the seas, and land attack. Future development in submarines will aim at maintaining their versatility while also minimizing their cost and thereby maximizing their return on investment. Cost-effective platforms such as midget subs and unmanned undersea vehicles will play an increasingly important role. Other examples of improving the cost-effectiveness of submarines include utilizing increased standardization in construction that also maximizes flexibility. Future submarines will employ increasingly modular designs where a standard submarine hull can be customized with various modules designed for specific missions. Such an approach will enable greater flexibility and adaptability, as the modules will be capable of repeated change and multiple combinations based on mission requirements. In addition, repairing and upgrading modular construction will be less costly and more efficient.

Increasing stealth will also be a critical requirement in the future development of submarines. Submarines that are electric, and thereby quiet, will become more valuable. The conversion of the *Virginia* class to an all-electric platform is one example of this trend. As detection technology has become more advanced, less expensive, and therefore more accessible, the risk to nonstealthy platforms will increase dramatically. Future tactical utilizations will require more versatility and multimission employment. Examples include increased roles in mine warfare, increased deployment of both unmanned undersea vehicles and unmanned aerial vehicles, an increased role in supporting SOF through the use of the Advanced SEAL Delivery System, and a more active role in intelligence gathering through the use of advanced sensor technology.

The possibility of future developments in the strategic utilization of submarines points toward greater emphasis on efforts to ensure access to

strategic regions. This emphasis will increasingly focus on the littorals. In an asymmetric effort to counter sea control and power projection capabilities of large powers, regional and small powers will likely pursue sea-denial and access-denial strategies. As technology such as missiles and mines improves and proliferates, these weapons will become more lethal and less expensive. Regional and smaller powers will likely utilize inexpensive and asymmetric weapons to prevent access to strategic areas. Examples of anti-access platforms include diesel submarines, mines, antiship cruise missiles, and chemical and biological weapons of mass destruction. Slow and easily detectable platforms will be especially vulnerable. With their combination of stealth, endurance, and firepower, submarines will play a key role in combating such strategies and ensuring access to strategic regions and protection of less stealthy platforms. As with all forms of warfare, submarine warfare will continue to change as future threats develop and future technologies improve.

WARFARE, SURFACE

Within the umbrella of surface warfare, warships perform several specific missions: interdiction, convoy escort, amphibious warfare, naval gunfire support, and local area air defense. Interdiction involves intercepting enemy warships at sea, with the intent to engage and sink the opposing warship in a surface combat.

Surface combat involves opposing warships engaging one another in combat for the purpose of damaging or sinking the enemy. As implied by its title, surface warfare takes place on the surface of the water and is distinguished from aerial or sub-sea combat. Most often, surface warfare takes place between navies of opposing nations, though other ships can be involved such as merchant ships and other privately owned craft. This entry describes the types of warships and the weapon systems involved in surface warfare.

Types of Warships

Warships are grouped in categories for classification purposes, though the definition of each individual category may have changed throughout the 20th century. Aircraft carriers are among the largest of naval warships, carrying 10 to 70 aircraft or helicopters that operate from a flight deck. As the center of naval battle groups, carriers are capital ships, warships used to gauge the relative strength of navies, and a component of a nation's international naval image.

Cruisers are large, multipurpose warships designed to operate at sea against a multitude of threats. Cruisers often carry surface-to-air missiles,

antiship missiles, torpedoes, guns, and one or more helicopters. Some cruisers carry land-attack missiles capable of attacking targets several hundred miles from the sea. These warships are capable of operating independently or as part of a larger task force, often serving as escorts for aircraft carriers. The U.S. Navy operates more cruisers than any other navy, all of them belonging to the *Ticonderoga* class of missile cruisers.

Destroyers primarily escort larger warships, though they can be detached from task forces for independent operations. Historically, destroyers served as escorts for larger warships and were considered too lightly armed to operate without support. As destroyers have grown in armament, their capacity for independent operation has increased. These vessels are equipped with weapons similar to those installed on cruisers, though some destroyers do not have a helicopter. The growth in destroyer capabilities has blurred the line between cruisers and destroyers.

Frigates and corvettes are also escorts by design, equipped with similar, though fewer, weapons than destroyers. In larger navies, frigates are most often found in an escort role, while in smaller navies frigates may be the largest warship in service. Frigates and corvettes are not typically equipped with a helicopter, though surface-to-air missiles, antiship missiles, guns, and torpedoes are common.

Patrol craft are warships smaller than frigates and corvettes used for coastal operations and patrolling. Equipped with machine guns, small caliber guns, and antiship missiles, patrol craft typically lack the defensive armament of larger warships. Due to their smaller size, patrol craft travel at higher speeds than frigates and destroyers, enabling them to rapidly close with their targets. Patrol craft are vulnerable to damage and lack the armor or damage control facilities to continue operations after repeated hits from guns or missiles.

Surface Combat

The first stage in a classic surface engagement is detecting and identifying the enemy. Then the opposing ships maneuver, seeking an advantageous position. Maneuvering continues while each side uses its weapons to injure and destroy opposing vessels. At some point, the combat ends with one of three results: sinking, surrender, or disengaging. After

British frigate HMS *Cornwall* (F 99) transits through the Persian Gulf. *Nimitz*-class aircraft carrier USS *John C. Stennis* (CVN 74) is nearby. The *John C. Stennis* Carrier Strike Group was conducting operations in support of the Global War on Terrorism.

Source: U.S. Navy photo by Mass Communication Specialist 2nd Class Ron Reeves (released).

surface combat, warship crews typically perform postcombat operations such as search and rescue of survivors and repairing damage caused by combat.

The initial phase of surface combat involves identifying and detecting the enemy. Historically, warships relied on visual sighting or reports from other friendly warships to accomplish this task. Modern navies still use friendly units, such as aircraft and submarines, to locate enemy ships and relay the sighting report to nearby warships. Radar and passive sonar allow warships to locate enemy ships beyond visual range, enhancing the ability of warships to detect their opponents.

Warships use a variety of weapons systems to engage enemy warships, including missiles, guns, torpedoes, and mines. Guided missiles are the most common type of antiship weapon employed by modern navies. These weapons are housed in prepackaged launchers and locate their target using an internal guidance system, such as radar or an infra-red sensor. Guided missiles typically skim the surface of the water while approaching the target and

sometimes perform a “pop-up” maneuver just prior to striking the target. This maneuver is designed to throw off the aim of any defensive antimissile systems the target is using. Given the widespread deployment of sophisticated antimissile systems, antiship missiles are often fired in salvos consisting of multiple missiles to maximize the odds of a single missile penetrating the ship’s defenses. The relative lack of armor on modern warships allows a small number of guided missile hits to render a warship incapable of combat operations. Guided missiles commonly have blast or fragmentation warheads designed to damage electronics, weapons, and other key systems. Antiship missiles range in size from small helicopter-launched weapons, such as the Penguin, to heavier missiles, such as the Tomahawk, that have ranges of several hundred miles.

Guided missiles are also the primary weapon used by warships to engage hostile aircraft and missiles. Modern radar systems allow warships to detect and engage aircraft and missiles far outside of visual range. Larger warships such as cruisers and

destroyers often carry two types of anti-air missiles, a longer range missile for engaging aircraft and a shorter range weapon for engaging incoming missiles. The range and sizes of these defensive missiles vary considerably based on the size of the warship and the assumed threat environment. For example, many American cruisers and destroyers carry large batteries of standard missiles that were originally designed to defeat massed anti-ship missile attacks by Soviet aircraft and submarines. Short-range missiles designed to intercept against anti-ship missiles are often paired with an anti-missile gun system, such as the Phalanx. These gun platforms fire several thousand rounds per minute and are automatically

aimed and fired once activated. This automation is necessary to counter the high speed at which anti-ship missiles travel. The defensive missile and gun systems of modern warships are most effective against attacking aircraft and missiles when paired with friendly fighters flying a combat air patrol.

Guns remain a common weapon for engaging targets of all types. While less frequent than has been the case historically, modern warships often carry one or more large caliber weapons, such as 3-inch or a 5-inch gun. Advances in gun technology have steadily increased the range and firepower of these weapons, providing navies with significant capabilities to engage targets far from the coast.

Recent Surface Warfare

Since the end of the Cold War, surface engagements between opposing warships have been rare. In recent conflicts, warships have been used as escorts and fire support platforms to assist ground operations. During the Persian Gulf War, warships from numerous Western navies supported ground operations against Iraqi forces using missiles and naval gunfire support. Helicopters operating from warships in the Persian Gulf sank several Iraqi patrol boats using air-to-surface missiles early in the conflict. Minefields near the Iraqi coast were cleared, an operation that resulted in damage to an American cruiser and a landing ship. Amphibious warships threatened landings on the Kuwaiti coast in an effort to divert Iraqi attention from the attack across the Saudi-Iraqi border.

Operation Deliberate Force in 1995 saw warships performing escort and search and rescue functions for aircraft operating against targets in Kosovo and Bosnia. Operations in Afghanistan have depended heavily on naval aviation, with the resulting need for escorts and support craft for aircraft carriers. To counter the threat of Somali pirates operating in the Indian Ocean, warships from many nations have cooperated to secure sea lines of communication used by merchant shipping. These operations utilize surface warships, helicopters, and aerial reconnaissance to protect maritime shipping. In the summer of 2011, American and Western navies assisted efforts by rebel forces to overthrow Colonel Muammar Qaddafi's government in Libya. These navies played an important role in the initial phase of the campaign by attacking Libyan air defense sites and command and control facilities with long-range land-attack missiles. Warships operated helicopters and fixed-wing aircraft to provide ground support for rebel troops.

WARFARE, UNCONVENTIONAL

Unconventional warfare (UW) is the use of military force in ways that are typically unexpected and non-traditional. Often, governments consider it advantageous to execute military actions in a manner that is deniable or that can achieve strategic effects without requiring full-scale, conventional warfare. This is the role of UW. UW options have become more prevalent in a world that is increasingly more interconnected through media, electronic communications, economic systems, and reliable intercontinental air travel. Typically, the more limited collateral damage of UW options can assuage wider conflict.

Background

Unconventional warfare is a relatively modern institution, though its origins can be traced back centuries. Perhaps one of the earliest recorded uses of UW was in the ancient Greek tale of the Trojan horse, wherein the walls of Troy were overcome not through direct attack but rather through an unconventional method: concealing Greek soldiers in the belly of a wooden horse that the Trojans took to be a gift. While the exact details of this story continue to be debated by scholars, the concept of incorporating atypical methods of surprise into a battle plan, achieved through unconventional means, would be institutionalized centuries later as UW, as a means for overcoming an enemy through nontraditional means.

American UW operations in the post-World War II era have been, by many accounts, relatively successful. The true record of these operations may never be known, owing largely to issues of security classification. What is clear is the growth in the development of UW forces—an indicator of the success of past operations and the degree of faith that some policymakers have invested in the future of UW. As a result, the United States has become the most prolific and successful state employer of UW,

and the remaining part of this entry will focus on the American military program of UW.

Types of Operations

UW doctrine includes the application of covert/ clandestine operations, direct action, internal defense, and reconnaissance efforts to achieve what are often sensitive mission objectives.

Covert/clandestine missions are those that are designed to be kept from public knowledge and are conducted under a cloak of secrecy, with the objectives of these missions often remaining classified.

Direct-action missions are those situations requiring a force to be inserted by sea, air, or land to directly attack, destroy, degrade, or capture a high-value objective.

Internal defense missions are training efforts designed to strengthen the organic ability of an allied government (e.g. South Vietnam, Iraq) to defend itself and its people against insurgents and other internal threats.

Reconnaissance missions provide information about a locale or situation that would not be obtainable through passive means, typically without making their presence known to those being observed.

The organization responsible for the coordination and oversight of American military UW operations is U.S. Special Operations Command (SOCOM). SOCOM is headquartered at MacDill Air Force Base, Florida, alongside U.S. Central Command. Supporting and providing forces to SOCOM are four service component commands.

U.S. Army Special Operations Command (USASOC), Fort Bragg, North Carolina

Air Force Special Operations Command (AFSOC), Hurlburt Field, Florida

Navy Special Warfare Command (NSW), Naval Base Coronado, California

Marine Corps Forces Special Operations Command (MARSOC), Camp Lejeune, North Carolina

Ground Employment

For the United States, ground employment of UW is largely the domain of the U.S. Army. For its part, the

army has developed a robust capability for engaging in UW operations in nearly any corner of the globe that is covered by land. In particular, the army has developed a particular strength in the use of UW forces to train and advise internal defense forces, with the intent of endowing indigenous forces with the ability to defeat threats that, if left unaddressed, might lead to wider conflict.

Most notable among the army's UW forces are the Green Berets. The Green Berets are formally divided into Special Forces Groups that develop an expertise in a particular portion of the world, cultivating specialized language and cultural skills among the members. The Green Berets are trained in the spectrum of UW doctrine and tactics and are considered among the most effective practitioners of UW in the world; they are best known for their prowess in the field of internal defense. Though the war was not a victory for the United States, the employment of Green Berets in Vietnam is one of the best examples of UW employment prior to the recent wars in Iraq and Afghanistan.

Along with the Green Berets, the army has established an aviation unit to support the actions of UW operators. This unit, the 160th Special Operations Aviation Regiment (SOAR), is stationed at Fort Campbell, Kentucky, and provides the facility to conduct UW aviation operations at night. This unit has been involved in UW operations ranging from Somalia in the early 1990s to Afghanistan and Iraq in the post-9/11 era.

Aerial Employment

Within the American defense establishment, perhaps the most unrecognized UW operations have been those undertaken through the air. The primary purpose of airborne UW forces is to surgically engage targets on the ground, insert forces and supplies into contested areas, and provide airborne platforms for refueling or other special missions.

The U.S. Air Force's (USAF) UW forces are almost entirely apportioned to AFSOC. With units stationed at two bases in the United States, and one each in Europe and Asia, AFSOC is able to move forces to any point on the globe within a matter of hours, which is itself an inherent strength for many UW forces and operations. Despite its somewhat limited basing infrastructure, AFSOC trains for operations across a broad range of training locations.

Some of the more notable aircraft currently assigned to AFSOC are turboprop, rotary, and tilt-rotor airframes, in contrast to much of the rest of the USAF. Specifically, AFSOC's inventory includes AC-130 gunships, MC-130 transports and aerial refuelers, and CV-22 tiltrotor transports. In fact, AFSOC counts almost no traditional jet aircraft among its primary fleet.

The heart of AFSOC's UW capability resides in its airmen. While its pilots, navigators, and enlisted aircrew perform as part of nearly every operational mission, the airmen that most differentiate AFSOC from the rest of the USAF are its specially trained Pararescuemen and Combat Controllers, who provide personnel recovery (rescue of downed aircrews) and directive support to combat aircraft, respectively. In the years after 9/11, AFSOC has been developing further capabilities to participate in counterinsurgent and low-intensity conflicts.

Naval Employment

Like the USAF, the U.S. Navy is platform dependent for many of its global operations, though the U.S. Navy's signature UW force is the notable exception to this rule. The well regarded and popularly celebrated SEALs (Sea, Air, and Land) are best known not for their nautical feats but rather for their successes on land. The surprise raid that resulted in the killing of Osama bin Laden in 2011 became a signature moment in naval history and for the SEALs but was an event that took place many miles from the ocean. This reflects the cross-dimensional nature of the SEAL operations.

The SEALs are trained at the Naval Amphibious Base in Coronado, California, and the regimen of this training is considered among the most difficult the military offers. After completing training, the SEALs are assigned to one of several teams and remain ready to deploy and take action, worldwide, in support of American policy objectives. The SEALs are trained in a variety of missions, but they have developed a strong reputation for direct action. In addition to the SEALs, the U.S. Navy has developed a force of armed, small, fast boats and associated operators that support the SEALs.

For its part, the U.S. Marine Corps has developed its own organization for UW missions, though until relatively recently they were not typically considered a formal part of the UW community—despite

their excellent reputation. Known as Force Reconnaissance, this group represents the U.S. Marine Corps's capability for executing UW doctrine. In the post-9/11 era, the U.S. Marine Corps has begun to reorganize its UW forces and establish them more firmly as a full partner in the UW community, most noticeably with the establishment of MARSOC in 2006.

Recent Operations

In the years following the end of the Vietnam War, the American military and policymakers recognized the value of UW forces and set about to institutionalize their existence and application. As a result, when subsequent conflicts emerged, the use of UW forces figured prominently.

Desert One (Operation Eagle Claw)

The first major employment of UW forces in the post-Vietnam era took place in 1980 and ended in disaster for the American forces carrying out the operation. In what was intended to be a rescue mission of American hostages taken during the storming of the American embassy in Tehran, American UW forces were sent into Iran aboard low-flying aircraft. The mission went awry after mechanical failures and the collision of a helicopter with a C-130 transport during a rendezvous in the Iranian desert, killing several UW operators. The mission was aborted.

Grenada

During the 1983 invasion of Grenada, American UW forces were utilized to capture an airfield and secure critical objectives. American UW forces, while encountering difficulties, took part in the first successful major operation since Vietnam.

Desert Storm

While several independent UW operations took place as part of Operation Desert Storm, one in particular stands out: Task Force Normandy. Task Force Normandy was given the objective of destroying critical Iraqi radar assets immediately ahead of incoming coalition aircraft bound for the first targets in Iraq. They successfully destroyed their targets with the use of U.S. Army Apache attack helicopters, having been led to their target by AFSOC helicopters.

Post-9/11

The wars in Iraq and Afghanistan have provided ample opportunity for the American UW community to validate the post-Vietnam investment made on it; thus far, the results suggest the investment made was a wise one. In particular, the application of UW forces, in conjunction with American air forces and Afghan allies, to defeat Taliban and al Qaeda forces in the first year of the war in Afghanistan serves as a strong example of the utility and efficacy of UW doctrine and forces. Additionally, the success of these efforts highlighted the ability of American UW forces to quickly achieve a strategic victory through tactical proficiency, at a cost—in both lives and treasure—that was presumably far lower than would have resulted from the application of conventional military forces. Also of note was the 2011 killing of the al Qaeda leader Osama bin Laden by a combined team of Navy SEALs and the army's 160th Special Operations Aviation Regiment. Despite the unexpected crash of one of the helicopters dropping the SEALs at the bin Laden compound, the joint team successfully completed their mission and accomplished one of the primary aims of the American fight against al Qaeda. In so doing, the forces involved firmly established the primacy of UW doctrine and operations in the post-9/11 era.

Urban Warfare

A major subset of UW is the conduct of operations in urban terrain, a doctrine and subset of operations typically referred to as urban warfare. Although urban warfare, as a concept, spans the spectrum from small unit operations in urban landscapes to, as has been suggested by some, area bombing of cities by air forces, it is typically associated with small unit operations on the ground. In the post-9/11 era, urban warfare is likely to become an increasingly important and regular aspect of military operations, given the locations and nature of the current wars and likely future conflicts. As this has become evident to the U.S. military and, in particular, to the UW community, new tactics, training, and weapons have been developed to meet the challenge.

The Future

The success of American UW forces in achieving what can be fairly described as stunning victories

against enemies and objectives, despite strong odds against them, has led policymakers to demand an increase in size and use of these forces. While the expense and time needed to train UW operators often exceeds the costs and time requirements to train conventional military forces, the ability of UW forces to quickly achieve challenging objectives, while limiting collateral damage, has nonetheless made them an attractive option. The success and popularity of UW forces, and the growth the community is experiencing as a result, has not been universally applauded, however. As the war in Iraq has come to an end and the conflict in Afghanistan slowly winds down, some have called for refocusing American forces away from UW options and UW-centric conflicts, like counterinsurgencies, back to what are seen as more traditional threats. However this debate may be decided, it is clear that UW has become a critical aspect of future conflicts, and the outcome of these yet to be decided military engagements will, at least in part, be determined by the highly effective and professional members of the American UW community.

WARRIOR CULTURE

In the final days of his tenure as army chief of staff in June 2003, General Eric Shinseki sent a memo to the U.S. Army's senior leadership outlining the

need to reemphasize the “warrior ethos” throughout the army as it transformed itself from peace to war. His successor, General Peter J. Schoomaker, adopted Shinseki’s strategy for transforming army culture, making it a top priority. Both generals believed that the army’s focus on the technical skills of a soldier’s military specialty had led soldiers to identify with their job to the detriment of their identity as a combatant and their basic combat skills.

The unpredictable and violent nature of the asymmetrical wars the army faced in Iraq and Afghanistan increased the likelihood that all soldiers would suddenly be faced with combat situations. An early example of the army’s new focus was Schoomaker’s public assertion that all soldiers were riflemen first. Schoomaker’s emphasis on marksmanship and other combat skills is a key component of a larger plan for the army to adopt a common warrior ethos.

To promote adoption of the warrior ethos throughout the army, Schoomaker and other leaders worked to alter army institutions. The most obvious example was the adoption of a new Soldier’s Creed embodying the values Shinseki and Schoomaker identified as key to the warrior ethos: placing the mission first, not giving up, and never leaving fallen Americans behind. The Soldier’s Creed appears in toto or in part on posters and wallet cards, in training documents and videos, and in training exercises and competitions.

In addition to public statements and distribution of the Soldier’s Creed, the army added formal training oriented toward developing the warrior ethos in initial training for both officers and enlisted personnel. In addition to an expanded focus on the warrior ethos throughout initial training, the army updated its basic combat course to include 5 hours of training on the warrior ethos. By the end of initial entry training, soldiers must verbally demonstrate an

A photo of a dog tag with the warrior ethos stamped on it at Camp Liberty in Baghdad, Iraq, April 15, 2010.

Source: U.S. Army photo by Sergeant 1st Class Roger M. Dey (released).

understanding of the warrior ethos by reciting and explaining the tenets of the Soldier's Creed.

To enhance and continue training in the warrior ethos, the army introduced a Warrior Ethos Training Support Package to assist leaders in embedding the warrior ethos in the regular training regime. The army renamed its Primary Leadership Development Course the Warrior Leader Course when it redesigned the curriculum to focus on the warrior ethos and combat skills in 2005 to demonstrate its goal of preparing junior noncommissioned officers for deployments. The Drill Sergeant School, which teaches noncommissioned officers to train new recruits, also added an emphasis on both living and teaching the warrior ethos to help drill sergeants better prepare new soldiers.

The army also mandated additional unit-level training focusing on the warrior ethos and combat skills. Hand-to-hand combat skills now form a key component in unit-level training and in individual and unit competitions. The goal of both hand-to-hand combat training and increased competitions based on endurance, will, and combat skills is to build mental and physical toughness among serving soldiers before they deploy.

Rewards and recognition are part of the army's efforts to emphasize the warrior ethos in the ranks. Honor graduates from Initial Entry Training receive awards for demonstrating both the skills and the mind-set of the warrior ethos, showing their peers the importance of the values and actions described by the warrior ethos. The army's highest decorations are awarded for service exemplifying the warrior ethos, a connection that the army now consciously makes. In 2004, army leaders added the warrior ethos as part of the promotion process, selecting for promotion those officers and noncommissioned officers who exemplified the warrior ethos. Local promotion boards included components requiring personnel to recite the warrior ethos and the Soldiers Creed or even requiring soldiers to deliver short speeches discussing these concepts.

Each of the branches of the U.S. military placed greater focus on its own interpretations of the warrior ethos after 2001. The Marine Corps, long noted for indoctrinating recruits in the values and skills of the marines' warrior ethos during basic training, increased its emphasis on combat skills and the warrior ethos after 2001. The most visible component of the Marine Corps's new effort is the Marine Corps Martial Arts Program, in which all marines receive

formal martial arts training designed to make them more effective in combat and enhance social cohesion.

The U.S. Navy and the U.S. Air Force also embraced the need to adopt service-specific versions of the warrior ethos, promulgating a Sailor's Creed and an Airman's Creed to showcase their values. Of these two services, the air force has pushed harder to instill the warrior ethos in personnel through an extended Basic Military Training program that focuses on combat skills and by defining all airmen as warriors regardless of their flight status. Like the army, the air force relies on its history to illustrate the service's warrior ethos by arguing that more members of the Eighth Air Force were killed in combat over Europe than the total number of marines killed during World War II. Emulating the army's methods, the air force also began to emphasize military skills in unit training and competitions.

WEAPONS, ANTI-AIRCRAFT

For almost as long as aircraft have been in the air, there has been a need to shoot them down. Unlike ground forces, however, aircraft operate in the air and at high speeds. Because aircraft are capable of moving in all three dimensions, targeting them is extremely difficult. The first antiaircraft weapons

were guns fired into the air. As antiaircraft weapons developed, militaries developed smaller caliber guns with high rates of fire, and larger artillery guns designed to create airbursts to damage or destroy enemy planes with shrapnel. The development of guided missiles following the Second World War provided armies with the means to destroy jet-equipped aircraft, which could operate at higher altitudes and at much higher speeds.

Antiaircraft Guns During the World Wars

World War I saw the first major use of aircraft and the need for antiaircraft weaponry. The primary antiaircraft weapons at this time were repurposed lighter artillery guns aimed upward, with timed fuses to detonate near an enemy plane. However, the difficulty of guessing the target's trajectory and height, as well as the amount of time needed to compute those figures, rendered antiaircraft fire largely ineffective. To counter the mobility of aircraft and prepare for enemy air operations, armies used sound detection systems and searchlights, providing soldiers the time to man their antiaircraft positions and send their own fighters to attack the enemy.

World War II saw the use of more highly effective antiaircraft weaponry. Specifically, the development of radar and the radar-guided gun, coupled with the proximity fuse, led to a vast improvement in the lethality of antiaircraft weaponry. Shells no longer had to be timed to strike the target; they merely had to come close enough to set off the fuse. Naval antiaircraft guns armed with proximity fuses were used to great effect against Japanese kamikaze attacks.

The German anti-air defense system was extensive. The largest at the start of the Second World War, it proved remarkably effective against the Allied bombing campaigns. Possessing radar-guided guns but lacking the proximity fuse, the Germans relied on airbursts to destroy aircraft, increasing the size of the shards produced by the explosives to increase the lethality of their antiaircraft artillery. German antiaircraft guns were rendered less effective as the Allies developed countermeasures. The release of hundreds of small strips of metal swamped German radar with multiple potential targets and shifted focus from the bombers.

Antiaircraft weaponry played an important role during World War II air campaigns. Apart from weakening the enemy's air force, antiaircraft guns also provided the secondary benefit of distraction. Targeting an enemy position from the air was difficult enough at the time without having to dodge

enemy fighters or antiaircraft guns. Bombers were forced to climb ever higher to avoid enemy fire, resulting in greatly diminished accuracy. For Allied forces, antiaircraft guns were not to be taken lightly, causing casualties on a par with, or greater than, enemy fighters. Lacking any means to identify friends or foes in the air during this period, there were also a number of cases of fratricide, when antiaircraft guns accidentally opened fire on friendly units. The later development of identifying friend and foe systems would limit the number of such events in the future.

From Artillery to Missiles

The first primitive surface-to-air missile (SAM) was actually developed by the Germans during the Second World War, though few of the weapons were properly tested and none saw combat. The development of high-speed jet fighters and bombers rendered gun-based antiaircraft weaponry virtually ineffective.

Number 2 Gun Crew, Battery D, 208th CA AA, man their 3-inch AA gun at New Fighter Strip, Dobodura, New Guinea (May 17, 1943).

Source: Photo by Private First Class John A. Moore. Courtesy of the U.S. Army Center of Military History, Signal Corps Collection, National Archives.

Capable of acting at higher ceilings, this new breed of aircraft became even more difficult to target, and missiles were seen as the next generation of anti-aircraft weaponry. The first models were designed to target high-altitude bombers on a steady flight. Early missiles used radar to track an enemy aircraft's position and direct the missile to match. The American Ajax was the first guided SAM missile, deployed in 1954. It was replaced by the Hercules in 1958, which was used until development of the Patriot missile system, which is still in use in the present day. In addition to these larger static positions, the Hawk SAM system was designed as a mobile anti-air weapon.

The Soviet Union saw the importance of SAMs in the aftermath of the Second World War, realizing the limited effectiveness of previous anti-aircraft weaponry. Having acquired a number of German missiles, the Soviet Union built on this technology. The first Soviet missile, the SA-1, was a German missile with ground guidance. Its successor, the SA-2, was

deployed in 1957. It was the missile that shot down an American U-2 reconnaissance plane in the Soviet Union in 1960 and another over Cuba in 1962.

In addition to large, long-range missile, there was a need for infantry in the field to defend themselves from enemy aircraft. Deployed in 1967, the Redeye was the first Man-Portable Air Defense System (MANPADS). With a maximum range of approximately 5 kilometers, it gave soldiers a means for defending themselves. Using infrared homing, it was designed to track on enemy engine emissions to destroy enemy planes. Designed primarily to destroy enemy attack planes, it did not grant a one-shot, one-kill ratio, but it was sufficient to give enemy fighters pause. In 1981, it was replaced by the FIM-92 Stinger missile, which uses infrared and ultraviolet tracking. Redeyes and Stingers were given to the mujahideen in Afghanistan, destroying hundreds of Soviet helicopters, cargo planes, and even fighters.

Three batteries of (Soviet-made) Iraqi SA-6b Gainful, solid-fuel, low-altitude surface-to-air missiles, mounted on medium-track transporters.

Source: Photo by Staff Sergeant Cherie A. Thurlby, U.S. Air Force.

The first Soviet MANPADS was the SA-7, deployed in 1968, which suffered from issues with its infrared tracking system, often losing the target if other heat signatures were nearby. The SA-14 incorporated a more effective infrared scanner, serving until its replacement by the lighter and more effective IGLA-S.

Modern Antiaircraft Weaponry

Modern stealth aircraft—which are significantly more difficult to detect on radar—and the increasing use of long-range (and so-called stand-off) precision-guided aircraft weaponry present serious challenges to the effectiveness of contemporary antiaircraft systems. Modern Russian weaponry involves self-propelled antiaircraft guns, armed with missiles for longer range targets

and cannons for shorter range targets. Examples include the 2S6 Tunguska M1 and the PANSTIR-S. American antiaircraft weaponry favors missiles, with Bradley Infantry Fighting Vehicles and High Mobility Multipurpose Wheeled Vehicles (popularly known as Humvees) armed with Stinger missiles. Automatic cannons are still deployed on ships to defend primarily against enemy antiship missiles, but they are also capable of targeting enemy aircraft at closer ranges. However, given the shift to smaller reconnaissance and attack platforms in the form of unmanned aerial vehicles, guns may return to a prominent role in order to decrease the cost of antiaircraft weaponry.

MANPADS have emerged as the most dangerous threat to modern aircraft. Easily transportable and smuggled into combat operations, MANPADS are significantly cheaper than the targets they are

WEAPONS, CHEMICAL

Chemical weapons are toxic substances that are usually released in a gaseous or vaporous format to produce lethal or incapacitating effects in humans or animals. Along with nuclear and biological weapons, chemical weapons are often described as weapons of mass destruction due to their potential for disproportionate destructiveness, the undue suffering they inflict, and the inability to use them to target combatants while not affecting noncombatants.

Types of Chemical Weapons

There are several varieties of chemical weapons, distinguished by the different physiological effects they produce. For example, choking agents (or lung-damaging agents) such as phosgene (North Atlantic Treaty Organization weapon designation: CG), diphosgene (DP), chlorine gas (CL), or chloropicrin (PS) produce severe irritation of the respiratory tract and/or pulmonary edema, or fluid buildup in the lungs. Nerve agents such as tabun (GA), sarin (GB), soman (GD), cyclosarin (GF), or methylphosphonothioic acid (VX) inhibit the neurotransmitter acetylcholinesterase, which can arrest the victim's respiratory functions within minutes. Vesicants, or blister agents, such as sulfur mustard (HD or Yperite), nitrogen mustard (HN1–3), lewisite (L), or phosgene burn their victims' skin, eyes, lungs, and other types of exposed flesh. While the injuries produced by vesicants are seldom immediately lethal, their treatment is lengthy and painful, and infection is a concern. Incapacitating agents such as tear gas (CS) cause severe lachrymation,

or watery eyes, and anticholinergics or nerve agents such as BZ cause temporary disorientation. Although the 1993 Chemical Weapons Convention (CWC) bans the use of incapacitating agents in warfare, they are not always considered chemical weapons due to their nonlethal effects. Defoliants such as Agent Orange have been used in warfare to clear vegetation and destroy crops and, therefore, are sometimes considered chemical weapons. Although both the 1925 Geneva Protocol and the 1977 Convention on the Prohibition of Military or Any Other Hostile Use of Environmental Modification Techniques may be interpreted as banning the use of these agents in warfare, the CWC does not explicitly ban the use of these weapons if they are used primarily to destroy plants. White phosphorus, which is frequently incorporated into tracer bullets and can be used to provide smoke-screens, is also occasionally described as a chemical weapon because it releases a noxious gas and causes chemical burns. Like defoliants, however, white phosphorus does not fall under the purview of the CWC and is considered a legal incendiary weapon.

History of Chemical Weapons Use

Although premodern warfare arguably saw the use of primitive types of chemical warfare—in the form of noxious smoke used to disorient an enemy—the large-scale use of chemical weapons began in the First World War. The French initiated the use of chemical weapons in August 1914 by using tear gas grenades against the Germans, who responded by using canisters of chlorine and phosgene to spread deadly gas on the battlefield. The British and French responded with artillery shells filled with phosgene and mustard. Although the use of gas was common in the early years of the war and initial casualties were staggering, both sides soon developed effective protective measures—such as filter respirators—that reduced later casualties. Indeed, although 100,000 metric tons of gas were used by the Germans, French, and British by the end of the war, only 91,198 battlefield deaths were caused by gas. Nevertheless, the injuries caused by chemical weapons—in the form of burns, eye injuries, and respiratory damage—were painful and crippling and required lengthy and costly treatment. It was the lingering health effects of chemical weapons on soldiers returning from the war that began to turn international public opinion against chemical warfare.

Given the widespread use of chemical weapons during World War I, it is understandable that

several states—including the United States, the United Kingdom, France, Italy, the Soviet Union, and Canada—assumed that chemical weapons would be used in later conflicts and invested heavily in the development and stockpiling of chemical agents in the interwar period. Lingering international dread of chemical warfare resulted in the creation of the 1925 Protocol for the Prohibition of the Use of Asphyxiating, Poisonous or Other Gases, and of Bacteriological Methods of Warfare, more commonly known as the Geneva Protocol. Parties to this treaty forswore the use in war of asphyxiating, poisonous, or other types of gases, as well as bacteriological weapons. However, the Geneva Protocol did not ban research or development of chemical weapons, and several signatories to the protocol submitted reservations allowing themselves to respond in kind if they were attacked with chemical weapons. These reservations reduced the Geneva Protocol to a “no first use” agreement, and international chemical weapons stockpiling efforts continued unabated.

The interwar period saw the limited use of chemical agents against groups that could not retaliate in kind. During its 1935 invasion of Abyssinia, Italy used mustard gas against Ethiopian forces and received much criticism from the League of Nations for blatantly breaking its commitment to the Geneva Protocol. Between 1937 and 1945, the Imperial Japanese Army carried out more than a thousand chemical weapons attacks during its occupation of China, using choking agents, vesicants, and incapacitating agents.

Even though both Axis and Allied states had accumulated large stockpiles of chemical agents, neither side utilized chemical weapons against the other’s militaries during the Second World War. This has been attributed both to an increasing global distaste for chemical weapons, and a commitment by world leaders to honor their Geneva Protocol obligations. Adolf Hitler himself had been injured in a mustard gas attack in October 1918, suffering temporary eye injuries as a result. It is often argued that this firsthand experience contributed to Hitler’s personal aversion to chemical warfare and decision to not use chemical weapons, to which Allied states responded in kind. The nonuse of chemical weapons during the Second World War and most major conflicts since has led scholars to argue that since the First World War, a widespread agreement has emerged among states that the use of chemical weapons violates international morality. Though this “chemical weapons taboo” has been severely tested by later uses of chemical weapons, the opprobrium

with which the international community continues to greet each use of suspected use of chemical weapons suggests that this norm is alive and strong.

During the Cold War, American chemical weapons research efforts focused on improving its supplies of sarin and VX and the development of means of dissemination, including rockets and artillery. Over the same period, the Soviet Union created the world’s largest arsenal of chemical weapons—approximately 40,000 metric tons compared with America’s 30,000-ton arsenal—which included several types of choking, nerve, and blister agents and delivery systems such as missiles, bomblets, and artillery shells. In 1969, public sentiment against chemical weapons caused the administration of Richard M. Nixon to halt production of chemical weapons and begin negotiations over chemical weapons disarmament. The Soviet Union doubted American sincerity about its plans to eventually discontinue its chemical weapons program and, therefore, continued developing and producing chemical weapons until about 1993. Despite its commitment to chemical disarmament, during the 1970s and 1980s, the United States considered replacing its deteriorating unitary stockpile with somewhat safer binary chemical weapons, which consist of two chambers filled with two less-deadly precursor chemicals, separated by a glass barrier. However, in 1990, after the U.S. chemical industry adamantly refused to produce precursors for the binary program, the army was not able to meet a congressionally mandated deadline for the production of a set volume of binary weapons. The binary modernization project was dropped, and the United States fully committed itself to pursuing chemical disarmament.

During the 1980–1988 Iran-Iraq War, Saddam Hussein regularly authorized the use of chemical weapons against Iranian troops, beginning with the use of tear gas in 1982 and progressing to mustard gas and tabun in 1983 and 1984, respectively. Initially, the Iraqis lacked expertise with chemical weapons, producing few casualties, but they soon learned how to use these weapons to produce greater casualties. However, because Iranian forces quickly adopted better protective equipment, Iraq failed to attain a decisive combat advantage from its use of chemical weapons. In March 1988, Saddam Hussein launched a 3-day mustard and nerve gas offensive against the Iranian-occupied city of Halabja, killing 5,000 to 8,000 people, most of whom were Kurdish civilians. Though these actions failed to elicit a forceful response from the international community,

they served to heighten awareness among developed countries that their civilian chemical exports could be used to make weapons, for Iraq had reportedly obtained precursor chemicals and equipment through legitimate trade with American and Western European businesses. In response to this dual-use problem, chemical-exporting countries created an informal international organization called the Australia Group in 1984 to promote the harmonization of chemical export regulations and, thereby, prevent future chemical proliferators from obtaining chemical precursors through legal trade.

In August 1990, Iraqi forces invaded Kuwait. Given Iraq's recent history with chemical weapons, the coalition that formed to attack Iraq in January 1991 in response to the Kuwait invasion expected that Iraqi forces would respond with chemical weapons. However, Saddam Hussein never used chemical weapons against coalition forces even though Iraq maintained an extensive chemical weapons program. The terms of Iraq's surrender, as overseen by the UN Special Commission (UNSCOM), required it to dismantle its chemical weapons programs and destroy its chemical weapons stockpiles. Iraq was frequently criticized for refusing to cooperate with UNSCOM inspectors. Nevertheless, when UNSCOM left Iraq in 1998, it was reasonably confident that the vast majority of Iraq's chemical weapons program had been dismantled. During Operation Desert Fox in 1998, the United States bombed several remaining suspected sites. However, given Iraq's recalcitrance in dealing with UNSCOM, some governments—in particular the United States—were uncertain whether Iraq's chemical weapons programs were completely defunct. Despite a lack of evidence, suspicions that Iraq maintained a secret chemical weapons program figured prominently in the George W. Bush administration's justification for attacking Iraq in March 2003. Invading forces searched intensively for Saddam's alleged chemical weapons labs and scientists, but only a small number of corroded chemical weapons munitions in various stages of assembly were reportedly ever found and not the vast, secret programs given as one justification for a preemptive war.

On March 20, 1995, a large and well-funded Japanese doomsday cult called Aum Shinrikyo led by guru Shoko Asahara released sarin gas into five trains in the Tokyo subway system, killing 12 and injuring as many as 5,000. Police investigations into Aum's activities prior to the attack, including previous attempts to disseminate anthrax, sarin, and

botulinum toxin, revealed that even highly motivated and well-funded terrorist groups face several obstacles to making and using chemical weapons. For example, producing chemical weapons on a large scale required the use of extensive facilities and specialized equipment and materials, which, despite the protection offered Aum by its status as "religious legal entity," had not gone undetected by law enforcement or suppliers. Furthermore, even though it was adept at recruiting well-educated scientists and engineers, Aum faced continued difficulties in both purifying the chemical weapons it produced and in devising means to disperse the weapons to allow for maximum casualties. Finally, a previous attempt to release botulinum toxin in Kasumagaseki Station failed when the cult member tasked with carrying out the attack purposely loaded the briefcase sprayers with water instead of the toxin, evidently due to a belated aversion to mass murder. Thus, though the Aum Shinrikyo attack raised international fears of weapons of mass destruction terrorism, and resulted in the creation of numerous domestic programs to better prevent and respond to weapons of mass destruction terrorist attacks and greater international antiterrorist cooperation, Aum's history arguably highlights the technical and psychological barriers still faced by nonstate actors in using chemical weapons.

On October 23, 2002, Chechen terrorists seized a packed Moscow theater, taking all 850 to 900 occupants hostage. After a 2-day standoff, Russian Spetsnaz forces released an as-yet unknown chemical agent into the ventilation system to neutralize the rebels, prior to recapturing the theater. Thirty-nine rebels and at least 127 hostages were killed by the gas. After much mystery over precisely what type of chemical had been employed during the crisis, the Russian health minister identified the agent as a powerful incapacitating fentanyl derivative called Kolokol-1.

The Chemical Weapons Convention

Negotiations over a multilateral chemical disarmament treaty began in 1972. The CWC was finally opened for signature in 1993 and entered into force in 1997. The CWC is remarkable both for its extensive verification protocol, allowing international inspectors representing the Organisation for the Prohibition of Chemical Weapons to conduct regular inspections of known or suspected chemical weapons facilities in signatory states with very little notice, and for its massive schedule of banned

chemical weapons and controlled chemical precursors. Under the terms of the CWC, member states were expected to make yearly declarations of their current and former chemical weapons activities and stockpiles and destroy these stockpiles by April 2012, but this deadline was not met by all signatories. As of mid-2013, 188 states, representing 98% of the world's population and chemical industry, were parties to the CWC and were working to dismantle their chemical weapons programs and stockpiles. Only five states—Angola, the Democratic People's Republic of Korea (North Korea), Egypt, Somalia, and Syria—have neither signed nor ratified the CWC, and two others—Israel and Myanmar—have signed but not yet ratified the treaty. The Organisation for the Prohibition of Chemical Weapons estimates that as of November 30, 2011, 50,619 metric tons or 71.1% of the world's declared stockpile of 71,195 metric tons of chemical weapons have been verifiably destroyed since the CWC's entry into force.

Although most CWC member states have succeeded in destroying their chemical weapons stockpiles and programs, some states, in particular Libya, the United States, and Russia, are taking longer to fully eliminate their chemical weapons, and this task will not be completed until about 2027. In the case of the United States and Russia, this failure to meet the CWC-mandated deadline is due less to a weak commitment to disarmament and more to the vastness of both states' chemical stockpiles and, in the case of Russia, irregular and insufficient funding for the destruction project. In the case of Libya, delays in disarmament stem largely from a malfunction in its neutralization unit, which forced the suspension of its destruction process in February 2011. Protests against the Qaddafi government, and later its overthrow, delayed the repair of the malfunctioning unit. Anti-Qaddafi forces revealed toward the end of the Libyan civil war that Qaddafi may have maintained secret chemical stockpiles, which called into question Qaddafi's commitment to chemical disarmament. However, the government that took over after Qaddafi's overthrow indicated its willingness to cooperate with the Organisation for the Prohibition of Chemical Weapons to complete the destruction process in a timely fashion.

A few states are suspected of maintaining illicit chemical weapon programs and stockpiles. North Korea, not a party to the CWC, is suspected of possessing chemical weapons research and production facilities capable of producing 5,000 metric tons of

mustard gas and nerve agents annually. The United States has indicated that it suspects that China, a party to the CWC, has maintained an advanced chemical weapons program, capable of producing a variety of agents. Egypt, another nonsignatory, is likewise suspected of maintaining a program capable of producing phosgene, mustard gas, sarin, and VX, though there is little conclusive evidence of this. It is possible that Syria, another nonsignatory, possesses a small program focusing on sarin, mustard gas, and VX. It is also possible that Ethiopia (a CWC member state), Israel, Myanmar, and Taiwan have undeclared rudimentary chemical weapons programs. Nonetheless, the few basic programs known or suspected to exist are a far cry from the dozens of known or suspected chemical weapons programs that existed in the 1980s and 1990s and are an indication of the diminishing relevance of chemical weapons, which can be attributed to several factors including technical and psychological obstacles faced by both states and nonstate actors, the continued effectiveness of protective equipment, the efficacy of current chemical disarmament treaties, and the increasing significance of the chemical weapons taboo.

WEAPONS, NONLETHAL

Nonlethal weapons are devices intended to incapacitate personnel while minimizing physical harm to the group or individual with relatively reversible effects. These weapons have been developed independently and in concert with lethal weapons. Some of the devices have unique capabilities that require specific training, while others are simple in design and employment. There are a range of effects that are gained by the employment of nonlethal weapons, ranging from irritating to incapacitating. Additionally, the development of nonlethal weapons has extended to disabling equipment without employing lethal means. While there has been debate over defining nonlethal weapons, there has also been debate over the term *nonlethal* because nonlethal weapons can have lethal effects. The military has defined nonlethal weapons in Joint Publication 1-02 as follows:

Weapons that are explicitly designed and primarily employed so as to incapacitate personnel or material, while minimizing fatalities, permanent injury to personnel, and undesired damage to property and the environment. a. Unlike conventional lethal weapons that destroy their targets through blast, penetration, and fragmentation, non-lethal weapons employ means other than gross physical destruction to prevent the target from functioning. b. Non-lethal weapons are intended to have one, or both, of the following characteristics: (1) They have relatively reversible effects on personnel or materiel. (2) They affect objects differently within their area of influence.

The development of nonlethal weapons has illuminated the need for policy in this area. As commanders identify the need to employ less lethal weapons, a strategy and ultimately a national policy regarding the use of the weapons are needed. Prior to the end of the Cold War, the enemy was easily identifiable, and engagements with the enemy were more clearly defined. Subsequent to the Cold War, the enemies the United States faced were not always uniformed, and engagements with the enemy were defined not by victory but by measures of success or stability. The employment of lethal weapons does not always result in stability—thus the need for a less lethal option.

Background

Historically, nonlethal weapons have been developed and employed by military forces, but not on an

equitable scale of the post-Cold War era. The dawn of nonlethal weapons came in the 1960s. During this time, an increase in demonstrations and riots was accompanied by pressure for national policies to restrict the use of lethal force. The 1967 report of the President's Crime Commission on Law Enforcement and the Administration of Justice recommended that research and scientific study be utilized in solving the problems of law enforcement. This gave rise to a commercial industry, albeit small in the beginning, devoted to the research, development, and production of nonlethal weapons. The first reaction was to turn to the military and their capabilities. Irritant chemical weapons, developed by the military, were the most mature and developed technology and, therefore, the most widely adopted. Following this, a technological explosion occurred in the late 1960s and 1970s, which produced an array of weapons that ranged from a variety of irritant gases to kinetic weapons that produced blunt force trauma. Some of the weapons studied produced unacceptable levels of injury, while others were easily defeated. There was a need for balance and the ability to produce scalable effects.

The military gave little attention to nonlethal weapons prior to the end of the Cold War. During the Somalia intervention, the Task Force Commander of United Shield, Lieutenant General Anthony Zinni, made the decision to use nonlethal weapons to cover the extraction of UN peacekeepers. Because nonlethal weapons had not been a serious consideration in the past, the marines had to use existing technology and train on the use of force and scalable effects, equipment to which they had not previously been exposed. Meanwhile, policymakers were grappling with political and legal ramifications of the use of these weapons. This was not their first use, but it was their first large-scale employment. Nonlethal weapons were more frequently utilized during subsequent operations in Haiti, Bosnia, and Kosovo.

Categories and Types

Within nonlethal weapons, there are two broad categories: (1) point weapons, designed to target an individual person or single piece of equipment that is being targeted, and (2) area weapons, designed to target a group of individuals or cluster of equipment. Determinations of the target need to be made when there is a need for the employment of a nonlethal weapon. In a crowd, an individual who is the instigator or possesses a weapon may be the point target. Another scenario may entail

that the entire crowd needs to be dispersed to afford stability to the situation.

Within the categories are two overarching types, kinetic and nonkinetic. Kinetic provides contact with a physical object and typically gives blunt force trauma. Examples of this would be a projectile fired from a weapon (point) or a grenade that disperses rubber balls (area). Nonkinetic are those weapons that offer no contact, yet still produce pain or discomfort. An example of this would be a noise-producing device. While these categories and types define many nonlethal weapons, there are those that policymakers have to categorize based on the employment and desired effects. These can include gases, sprays (pepper), and potentially directed energy weapons.

Employment and Effects

The employment of nonlethal weapons enables a commander to obtain a desired outcome without the effects of lethal weapons. The challenge in employing nonlethal options is to balance the desire for a certain outcome with the use of the least amount of force necessary. To ensure success, a commander cannot completely rely on nonlethal weapons but must have lethal options as a standby in case the situation merits their use. The other side of balance is the overuse of nonlethal weapons. A person is less apprehensive to employ a weapon when he or she knows that it will not kill or maim an individual. The military strategist Carl Von Clausewitz stated, "The political objective will determine the military objective to be reached and the amount of effort it requires." The employment of nonlethal weapons may not have the desired effort or effects that the military objective warrants.

While many nonlethal weapons have been generated to produce a specific effect, the future of nonlethal weapons is to produce scalable effects. Most nonlethal weapons have been researched and developed to produce a singular effect on a point or area target, and this target is not defined within a military objective. In other words, when commanders are planning for missions and want to incorporate nonlethal weapons, there has not been significant production of these systems specifically for use on military objectives. This is where scalable effects enter. A military commander who has an objective to seize a building may not want the collateral damage associated with conventional weapons. This is where the nonlethal weapons with scalable effects designed for military operations have a role.

Nonlethal Weapons Systems

Nonlethal Bursting Hand Grenades. These are designed for crowd dispersal. After a 3-second delay, a one-million candle power flash and 150-decibel bang will accompany the release of the 100 rubber pellets in a 360° direction.

The 40-Millimeter Sponge Grenade and Crowd-Dispersal Cartridge. It is a point target munition with a range of 10 to 50 meters. It has a single projectile made of hard plastic and foam rubber. The crowd-dispersal cartridge consists of 48 small rubber balls and is an area target munition with a range of 10 to 30 meters. Both rounds are fired from the M203 grenade launcher.

The Active Denial System. It uses millimeter-wave energy to stop, deter, and turn back an advancing adversary at relatively long ranges (publicly released to 750 meters). The active denial system transmits a narrow beam of energy at the speed of light. The energy penetrates 1/64 inch into the skin, quickly heating the skin's surface. Within seconds, an individual feels an intense heating sensation.

Oleoresin Capsicum or Pepper Spray. It is designed for point or area targets depending on method of delivery. It can be delivered in a spray stream or aerosol. The effects vary based on an individual's tolerance; however, having no reaction is an extremely rare occurrence and oleoresin capsicum has proven to be a very effective nonlethal weapon.

Vehicle Arresting Barriers. These are designed to stop vehicles. There are several different devices used for this purpose. Caltraps are four-pronged metal pieces, approximately 2 inches tall, that puncture tires. There are also mechanical vehicle arresting barriers that have proven to stop 7,500-pound vehicles at 45 miles per hour. Additionally, there are the traditional spikes that puncture and deflate tires.

The Long-Range Acoustic Device. It is designed for deterrence. The noise generated by the long-range acoustic device produces discomfort that is intended to deter a person or persons from achieving their goals.

Other types of nonlethal weapons are arresting foams, chemical irritants, various rubber bullets, batons, water cannons, and electrical shock devices (e.g., Taser). Some of these are not used as extensively because of their potential for producing lethal effects and the liability associated with their use.

Nonlethal Options and Future Capabilities

The future of nonlethal weapons will be determined by need, as with any weapon system. During the Cold War, the United States built nuclear arsenals and divisions of heavy armored vehicles, tanks. These weapons were built to combat an adversary that was building similar munitions stores. The post-Cold War era has given rise to small-scale, low-intensity conflicts in which traditional weapon systems and tanks are not as effective and are vulnerable to low-tech, improvised devices and explosives. The large-scale fight against a uniformed force has given way

U.S. Navy Master-at-Arms 1st Class Rudolph Antiporda trains Master-at-Arms 2nd Class Adam Harris and Information Systems Technician 3rd Class Suzanna Wong how to use a component of the Long Range Acoustic Device (LRAD) perimeter protection system aboard the aircraft carrier USS *Ronald Reagan* (CVN 76) while the ship is under way in the Pacific Ocean, March 7, 2011. LRAD is designed to deter unauthorized small vessels from coming within the safety perimeter surrounding the ship.

to decentralized, nonuniformed and often nonstate actors. Such adversaries pose a different problem. The soldier on the ground is forced to decide whether to employ his or her individual weapon system because the adversary is not in a uniform. As the United States has provided humanitarian aid and disaster relief and intervened in failing states that sponsor international terrorism, the nonlethal weapon option has been valuable. It will continue to be a viable resource and alternative for future conflicts as well as in humanitarian and disaster relief missions.

As nonlethal weapons are developed and used increasingly in the military, there will be options for soldiers, sailors, airmen, and marines to employ a weapon system that allows the de-escalation of an event without the collateral damage. Currently, members of the military are trained on and issued individual weapon systems that provide for deadly force. Issuing nonlethal weapons is situation and mission dependent, and not all members of the military are trained on the use of nonlethal weapons. Issuing nonlethal weapons and training members of the military in their use will drastically change the rules of engagement. Nonlethal weapons will give members an option for self-defense that will not have deadly effects. It will also give them the opportunity to shoot in a situation where they would otherwise not shoot. Possessing this option gives the military a more robust capability and the ability to work closer with populations.

WEAPONS, NUCLEAR

The discovery of radioactivity by the French physicist Henri Becquerel in 1896 led within 49 years to the detonation of the first atomic device on July 16, 1945, at Alamogordo, New Mexico. Within 5 years, a nuclear arms race between the United States and the Soviet Union had begun as both sides prepared for a long Cold War. This entry traces the intersection of global nuclear weapons development with political policies and charts the U.S. stockpile from early experimentation to a height of 32,000 warheads in 1966 to the 2012 level of approximately 5,000 warheads both deployed and in storage. In 2012, the U.S. nuclear force level consisted of approximately 4,340 strategic and 760 tactical warheads derived from 16 different warhead types, with deployed warheads arrayed on four types of strategic and two tactical weapons platforms. The U.S. military views tactical weapons as those deployed in a theater as part of operations, and strategic weapons as those deployed independently of any theater campaign. These definitions can have overlapping areas and differ in other nuclear nations. Strategic weapons platforms include intercontinental ballistic missiles (ICBM) based in silos, air-launched cruise missiles (ALCM), and air-dropped gravity bombs deployed by the air force, and submarine-launched ballistic missiles (SLBM) deployed by the navy. Tactical nuclear weapons are currently deployed by the air force as air-dropped gravity bombs and by the navy as sea-launched cruise missiles, though the latter are currently being retired.

Early Atomic History

The discovery of radioactivity soon coincided with Albert Einstein's insights into the nature of mass and energy. Physicists hypothesized that the atom had the potential to release enormous amounts of energy if its atomic structure could be altered. Neutron particles radiated into neighboring atoms could "fission" or "split" an atom. If this fission resulted in the release of more neutrons, a sustained chain reaction could turn more and more mass into energy. Certain elements such as uranium and plutonium had the properties necessary to be manipulated—enriched—into providing this chain reaction resulting in a bomb of fantastic power.

By the 1930s, physicists in many countries had made great strides in understanding nuclear forces. During the same period, the Western powers deemed Adolf Hitler's Germany a dangerous security threat, and the international scientific community understood that research into the most advanced nuclear physics took place inside Nazi Germany. By 1939, Albert Einstein sent a letter to President Franklin D. Roosevelt warning of the possibility of a German atomic bomb. Roosevelt set in motion the program that became the U.S. Army's Manhattan Project even before the United States entered World War II. He gave the final go-ahead for the program on October 9, 1941, as Europe, except for Britain, lay dominated by Hitler while the Soviet Union appeared to be on the brink of defeat.

The first test of the atomic bomb in July 1945 came 2 months after the defeat of Germany. Japan, however, continued to fight. After the battles of Iwo Jima and Okinawa, the prospect of a very costly U.S. invasion of Japan loomed large for the new president, Harry Truman. He ordered the atomic bombing of Japan to bring about the soonest possible surrender. The attacks on Hiroshima on August 6 (13 kilotons) and Nagasaki on August 9 (17 kilotons) instantly killed 70,000 and 40,000, respectively, with tens of thousands more succumbing in the next few months to radiation poisoning. The two bombings, plus the Soviet declaration of war, brought Japan's surrender on August 14, 1945.

Early Cold War, 1946–1970

The successful use of an atomic bomb in war soon convinced many policymakers and world leaders that nuclear weapons were not simply larger weapons. The new weapons appeared to offer immense power and prestige and the possibility of disrupting all old notions about the balance of power. The U.S. monopoly on atomic weapons, and the very early signs of what would become the Cold War, spurred the Soviet Union under Joseph Stalin to step up efforts to construct its own bomb.

In 1946, however, the United States began negotiations with the USSR through the new UN organization to put all nuclear weapons and research under international control. This effort stemmed from the belief that uncontrolled development could destabilize international relations and result in a future catastrophic atomic war. The negotiations failed due to disagreement over details of disarmament and

ultimately mistrust between the United States and the Soviet Union as the Cold War took shape.

The Soviet Union ended the U.S. atomic monopoly with the explosion of its first atomic bomb in 1949, which convinced Truman to authorize the development of a thermonuclear (fusion) weapon—the hydrogen bomb—in order to maintain U.S. nuclear supremacy. The process of using the heat of a fission reaction to fuse atoms of the element hydrogen into helium releases many times more energy than a fission reaction alone. This achievement came in 1952, but the Soviet Union followed months, not years, later in 1953. Thermonuclear weapons produced megaton yields and potentially vastly more casualties.

The Korean War (1950–1953) and the prospect of war in Europe between North Atlantic Treaty Organization and Warsaw Pact forces, combined with warhead miniaturization, brought about the development of battlefield nuclear weapons during the 1950s. These “baby bombs” became generally associated with “tactical” nuclear weapons, while the larger warheads were reserved for “strategic” missions.

Tactical nuclear weapons development in the 1950s and 1960s brought a varied array of weapons platforms. For the army, these included battlefield weapons such as nuclear artillery shells, short-range unguided rockets and guided missiles, and pre-positioned warheads called atomic demolition munitions. The army also deployed nuclear surface-to-air missiles. Navy tactical weapons included air-dropped gravity bombs, artillery shells for battleship guns, nuclear surface-to-air missiles, nuclear torpedoes, and nuclear antisubmarine warfare weapons such as nuclear depth charges and antisubmarine rockets. The Marine Corps fielded nuclear artillery and gravity bombs. The air force inventory included gravity bombs, surface-launched cruise missiles, and surface-to-air missiles. Cruise missiles are unmanned subsonic jet-powered aircraft. The Soviet Union also fielded a large mix of tactical nuclear weapons.

Development of strategic nuclear weapons during the 1950s and 1960s included army intermediate-range ballistic missiles (IRBMs), air force long-range bombers that deployed gravity bombs, ALCMs, and short-range attack missiles (air launched). The short-range attack missiles differ from ALCMs by having supersonic speed and solid rocket fuel. The air force also deployed long-range ICBMs that increasingly replaced bombers into the 1960s. The navy developed sea-launched cruise missiles and then SLBMs.

By the late 1960s, both the United States and the Soviet Union relied on a “nuclear triad” of strategic forces consisting primarily of long-range bombers, ICBMs, and SLBMs.

With such devastating firepower being constructed, the prevailing strategy for both sides developed into deterrence by threat of mutually assured destruction. A first strike would invite a massive retaliatory response. Any political crisis between the two nuclear superpowers threatened worldwide devastation.

The first major nuclear crisis was the Cuban Missile Crisis of October 1962. President John F. Kennedy deemed unacceptable the Soviet deployment of nuclear IRBMs to its ally Cuba. The United States demanded withdrawal of the missiles and blockaded the island. The threat of an American invasion loomed, and many around the world feared the onset of a nuclear World War III. However, after 13 days, Kennedy and the Soviet leader Nikita Khrushchev agreed that Soviet missiles would be removed if American IRBMs were also removed from Turkey with a U.S. pledge not to invade Cuba.

The danger of the Cuban Missile Crisis convinced both powers to begin the process of seeking ways to prevent nuclear catastrophe. One such way involved banning the above-ground testing of nuclear weapons. Atmospheric testing had already been the focus of concern by scientists for its effects on the atmosphere. Negotiations resulted in Washington, Moscow, and London signing the Nuclear Test Ban treaty in 1963.

Great Britain achieved its first nuclear detonation in 1952, and France in 1960, primarily to have an independent deterrent so as not to have to rely on the United States. The People's Republic of China in 1964 became the fifth nuclear state, driven in part by a deterioration in relations with the USSR. In 1968, the Nuclear Non-Proliferation Treaty (NPT) came into effect with the goal of preventing the spread of nuclear weapons, though not civilian nuclear energy projects. The treaty acknowledged five “legitimate” nuclear states. All other signatories pledged to not develop nuclear weapons but could get assistance in developing civilian nuclear energy programs. The problem of states not signing and therefore not being bound by these limitations persists to the present.

Later Cold War, 1970–1985

India's (non-NPT signatory) position as a nonaligned power during the Cold War demanded independent

security from its powerful neighbors, and by 1974, India had become a nuclear state. Israel (non-NPT signatory) sought to guarantee its existence at a time when many states in the region questioned its right to exist at all. Though the exact date is uncertain, during the 1970s, Israel became a nuclear state.

By the early 1970s, the United States and the Soviet Union engaged in a period of *détente*, driven by U.S. fatigue in the Vietnam War and China's threat to the USSR. Emerging technologies such as the nuclear anti-ballistic missile (ABM), and multiple independently targetable re-entry vehicles (MIRV), threatened to make the nuclear arms race more dangerous. The USSR had achieved a rough equality with the United States in nuclear capabilities, and both sides saw a cap on further weapons in their interest, along with a desire to restrict ABM systems that could threaten the "delicate balance of terror" involved in mutual deterrence. The Strategic Arms Limitation Talks resulted in a 1972 accord with two parts. (1) The Interim Agreement limited the mix of strategic nuclear launch platforms but did not reduce warheads. (2) The ABM Treaty severely limited the deployment of ABMs. All certification of compliance centered on "national technical means" such as satellite reconnaissance and not on-site verification.

The era of *détente* remained strained and the Strategic Arms Limitation Talks II of the late 1970s did not result in further agreements, but floundered on the Soviet invasion of Afghanistan in 1979. This reinvigorated Cold War of the early 1980s saw the United States and USSR engage in a renewed buildup in nuclear arms. The other nuclear states deployed weapons in the tens or at most hundreds while the U.S. and the Soviet arsenals stood at nearly 20,000 each. The United States also began research into a multilayered partially space-based missile shield over the entire United States, dubbed "Star Wars" by the press. Emerging new "stealth" technology also sought to improve bomber penetration of Soviet air space.

The 1970s and 1980s saw concerns over the rise of international terrorism emanating from the Middle East turn to concerns about the prospect of nuclear terrorism. The development of smaller sized warheads and worries over lost, stolen, or loose nukes in the hands of terrorists brought about counterterrorism plans to find and prevent the smuggling of such weapons into a major city. In 1974,

the United States developed the Nuclear Emergency Search Team to be able to find and disable a nuclear device. The United States held counterterrorism exercises such as "Mighty Derringer" in 1986 that simulated an atomic terrorist threat to Indianapolis, Indiana.

Instability in the Middle East driven by the Israeli-Palestinian dispute, the ongoing Soviet War in Afghanistan, and the Iran-Iraq War, coupled with the suspected Israeli possession of nuclear arms, propelled concerns about nuclear proliferation in the region. Israel, in particular, strove to prevent its enemies from developing nuclear weapons and in 1981 successfully bombed an Iraqi facility engaged in nuclear weapons development.

End of the Cold War

The reduced tensions of the Cold War after 1985 set in motion a swift series of events as the U.S. president Ronald Reagan and the new Soviet leader Mikhail Gorbachev began negotiations to reduce, rather than limit, the number of nuclear weapons in their arsenals. Driven by the economic realities of an arms race the Soviet Union could no longer afford, and vowing to open and restructure Soviet society, Gorbachev, along with Reagan, sought to end the Cold War and reduce the nuclear burden and threat that had hung over the world for decades. The 1987 Intermediate-Range Nuclear Forces Treaty eliminated the IRBM class, and the first Strategic Arms Reduction Treaty (START I) signed in 1991 began the slow reduction by both sides of their nuclear arsenals. At the end of the Cold War, shortly before the Soviet Union broke apart, the U.S. arsenal stood at approximately 20,000 warheads with 12,000 classified as strategic, while the Soviet stockpile totaled approximately 30,000 warheads with a similar number viewed as strategic.

Soviet underground nuclear testing ended in 1990, followed by the United States in 1992. Other nuclear states continued, but the vast majority of all nuclear tests had been conducted by the two superpowers. Through the next two decades, the START II and START III treaties sought further reductions in strategic weapons but stalled due to tensions that continued beyond the end of the Cold War. Events such as the enlargement of the North Atlantic Treaty Organization into Eastern Europe, the wars in the former Yugoslavia, and the withdrawal of the

United States from the ABM treaty tested relations between the United States and the new Russian Federation. The Strategic Offensive Reduction Treaty went into effect in 2003 and was in force until February 2011, when it was superseded by the “New START” treaty, which had the goal of further reducing strategic stockpiles and weapons launch platforms. As of 2012, the U.S. stockpile stood at 5,000 total warheads broken down into 2,150 deployed warheads: 1,950 strategic and 200 tactical; in storage the United States had an additional 2,390 strategic and 560 tactical warheads. In addition to the reductions and on-site verifications, a joint U.S.-Russian program known as Megatons to Megawatts began in the early 1990s to financially help Russia turn old Soviet warheads into nuclear fuel for U.S. civilian power reactors. The 2012 Russian stockpile stood at 5,500 total warheads broken down into 2,500 deployed warheads: 1,492 strategic and approximately 1,000 tactical; in storage, they had approximately 2,000 strategic and 1,000 tactical warheads.

Since 1991, both sides, without treaty obligations, dramatically reduced their tactical nuclear weapons stockpiles as the prospect of a major land war in Europe faded. The Russian Federation has held on to more tactical nuclear forces than the United States under the claim that Russia has greater need because of its long border with China and the continuing North Atlantic Treaty Organization deployment of tactical nuclear weapons. Limitations on tactical warheads have never been a part of any nuclear arms control agreements, including New START.

U.S. strategic forces still maintain a nuclear triad launch platform of long-range bombers prepared to use ALCMs or gravity bombs, ICBMs, and SLBMs. The United States has, however, reduced its tactical nuclear platforms to gravity bombs and sea-launched cruise missiles in recent years. Soon, only the air force will possess tactical nuclear weapons.

As of 2012, the other three nuclear states (China, Britain, and France) have fewer than 300 warheads of all types, and the three non-NPT nuclear states (Israel, India, and Pakistan) have fewer than 200 warheads each. North Korea likely possesses several small warheads as well. Most of these warheads would be considered tactical by U.S. and Russian standards. Definitions of *tactical* and *strategic* have always been somewhat ambiguous for certain classes of nuclear launch platforms. Certainly, North Korea

believes that possession of any nuclear weapons will have strategic value for them.

The Arms Control Association provides data on the nuclear weapon capacity of the parties recognized as nuclear weapon states and of other states known to possess atomic weapons in its report *Nuclear Weapons: Who Has What at a Glance*.

Impact of September 11, 2001, Attacks

Concerns over a suspected Iraqi nuclear program led the victorious 1991 Persian Gulf War coalition to demand an end to the program along with Iraq’s chemical and biological weapons programs. An International Atomic Energy Agency (IAEA) inspection regime in Iraq continued through the 1990s. Pakistan (non-NPT signatory) joined the nuclear club in 1998 to deter and balance its traditional enemy India. Both Iraq and Pakistan caused ongoing concerns about proliferation. The 2001 terrorist attacks on the United States by al Qaeda Islamist radicals, however, strongly refocused American concerns over nuclear terrorism and proliferation in the Middle East, even as the threat of global nuclear war waned. Western intelligence networks centered attention on the rogue Pakistani nuclear scientist A. Q. Khan. Nuclear proliferation concerns propelled the reinvigorated post-Cold War UN IAEA to step up efforts to monitor suspected secret nuclear programs in Libya, Iraq, Iran, and North Korea. Iraq was invaded by the U.S.-led coalition in 2003 amid concerns of a continuing nuclear, chemical, and biological weapons programs. The unraveling of the A. Q. Khan network, also beginning in 2003, and its link to Libya and others, led to the Libyan decision to disband and turn over its nuclear program to the IAEA. In the pivotal year of 2003, the IAEA also reported that Iran had failed to meet many of its obligations under the NPT. Postinvasion inspections in Iraq revealed that the Iraqi nuclear program had been terminated by the 1991 Persian Gulf War and aftermath. IAEA efforts met with failure in North Korea as that nation withdrew from the NPT in 2003. North Korea joined the ranks of the nuclear states in 2006, possibly to deter U.S. action such as in Iraq.

During the War in Afghanistan that began in 2001, attacks by Taliban and al Qaeda forces that spilled over into the tribal areas of Pakistan have led to concerns over the security of Pakistan’s nuclear

stockpile of an estimated 90 to 110 warheads. Publicly, U.S. officials have repeatedly expressed concern but also satisfaction with Pakistan's efforts to upgrade its security measures.

The suspected Iranian nuclear program in particular continues to elicit scrutiny from the United States, other major powers, and the IAEA. Under extreme pressure from the United States and other Western powers, Iran defiantly maintains that its nuclear program is for civilian nuclear power generation, which all NPT signatories have a right to research and possess under monitoring by the IAEA. However, due to Iran's political history and its relationship to Western powers, and especially the United States, since the 1979 revolution, the question of trust became a key problem. At the heart of the issue is the process of producing nuclear fuel. A bomb must have high-grade enriched fuel that can provide the chain reaction necessary for an explosive reaction. Nuclear power generation need not have that high a grade of fuel. According to the IAEA, Iran has had a problem with full transparency of its nuclear research program. Backed by IAEA reports since 2006, the UN Security Council has demanded that Iran suspend its nuclear fuel processing until better monitoring, and ultimately trust, is reestablished. For the Western powers, this has been very difficult to assess, as Iran has refused to fully cooperate with the IAEA and, in the years since 2001, has built a dispersed and deep underground nuclear research program. Since 2001, U.S. officials have repeatedly stated that the United States will not accept a nuclear-armed Iran; Israel also uses similar language.

Whether or not Iran or any other state wishes to join the nuclear weapons club is a matter of contentious debate at present. Historically, the possession of nuclear weapons has never fully rewarded those states that sought them. All nuclear weapon-armed states saw a utility in possessing nuclear weapons. Security through deterrence is the primary reason, but issues of prestige, status as a world power, and greater diplomatic influence are also key factors. Possession of nuclear weapons did not prevent the end of the British and French empires and their decline as great powers. Possession of more than 30,000 nuclear weapons did not prevent the breakup of the Soviet Union. Status and prestige could appear fleeting, the much sought-after influence was never as powerful as imagined, and the

cost was staggering. The record of utility appears mixed. Even the perceived security of having nuclear weapons has always had to stand against the reality that, far from guaranteeing security, if deterrence failed, the state itself might be extinguished altogether.

WEAPONS, SPACE

A space weapon is any destructive device aimed to either operate in or take effect in space, with space defined as beginning approximately 37 miles above sea level. Space weapons can be categorized into two groups according to their design: (1) kinetic energy weapons and (2) directed energy weapons (DEWs). Kinetic energy weapons draw their destructive energy from their momentum, ramming into their target. They can also be equipped with chemical explosives to heighten their destructive power. DEWs utilize beams to destroy a target, usually in the form of high-energy lasers, particle beam weapons, or high-power radio frequency. DEWs can be earth-based laser weapons, with mirrors in orbit to reflect the beam to its intended target. When

space based, DEWs are propelled by either chemical rockets or electromagnetic forces. Space weapons can also be categorized according to their purpose: (a) offensive antisatellite weapons and (b) defensive anti-ballistic missile weapons. The design of offensive and defensive missiles is technologically similar, with the existence of one fueling the other.

History of Space Weapons

The first space weapon experiment, an American test by the name Project Argus, began in August 1958. Three high-altitude nuclear explosions occurred above the south Atlantic in an attempt to discern if nuclear explosions on the edge of space could utilize the properties of the earth's magnetic field to produce an artificial shell of rapidly moving electrons around the planet that would stay in place for some time. While the experiment was a success, the model did not lead to a workable antisatellite or antimissile weapon. Project Argus did, however, encourage further space weapon research. In October 1959, the United States effectively launched an antisatellite missile from an aircraft toward an orbiting satellite. While the missile missed its target by almost 30 miles, that was close enough to destroy the target with the radiation from a 1 megaton nuclear warhead. The primary focus of space weapon research in the 1960s was antimissile weapons, which were missiles themselves, equipped with nuclear warheads like the ones they aimed to intercept.

In 1967, the United States and the Soviet Union signed the Outer Space Treaty, which stressed the peaceful uses of outer space. Despite this, space weapons quickly became a key focus of the Cold War arms race. That same year, President Lyndon Johnson's administration announced that an anti-ballistic missile system, named Sentinel, was to be deployed around 25 American cities to protect part of the country from attacks. The system lacked proof of scientific effectiveness and received only lukewarm political support. But it seems that after so many years and so much money spent on the development of space weapons, the impetus to deploy them was irresistible. Despite massive expenditures and years of research, experts remained in doubt about these systems' effectiveness. This doubt led the United States to sign an Antiballistic Missile Treaty in May 1972. By the mid-1970s, the navy, air force, and army were no longer experimenting with

most kinds of space weapons, with only antisatellite weapons still in development.

In March 1983, President Ronald Reagan introduced the Strategic Defense Initiative (SDI), a plan dubbed Star Wars. Star Wars, or SDI, was a research program designed to explore the feasibility of space-based defenses against ballistic missiles. While the technological advances never materialized to make SDI a functioning defensive space weapon, the Soviet Union took Reagan's claims seriously, fueling tensions between the two countries. Reagan's successors reduced, and eventually terminated, SDI. Leaders such as Reagan, who advocated the deployment of space weapons, claimed that their existence would make nuclear war less likely through deterrence.

In the 21st Century

From the 1990s on, many nations launched increasing numbers of satellites into space, increasingly focusing attention on space militarization, as opposed to the weaponization of space. Countries use their satellites for military purposes such as communication, reconnaissance, and positioning. This form of space militarization does not equal space weaponization, since it does not attempt to deny other countries equal access. However, all the satellites in space are fragile objects and are vulnerable to destruction simply from being hit by other satellites. Hence, any maneuverable space object has the potential to become a weapon against other satellites.

Currently, no known weapons are present in space, and there are only rare examples of destructive weapons being deployed in space. In January 2007, China launched a missile into space, destroying an old Chinese weather satellite. This revealed that if China chose to, it could build a large number of antisatellite weapons that would have the ability to destroy U.S. satellites in low-earth orbit. In February 2008, the United States launched a missile defense interceptor to destroy an American satellite threatening to make an uncontrolled atmospheric reentry while carrying more than 1,000 pounds of toxic fuel. While not the aim of the mission, the destruction of this satellite demonstrated the ability of the United States to destroy other nations' satellites.

Each of the previous three presidents established a coherent position on space weapons. In 1996, President Bill Clinton signed a directive that

emphasized the peaceful use of space and vetoed plans for potential space weapons. His position echoed almost unanimous global opinion. In a reversal of Clinton's stance, President George W. Bush signed a new national space policy in 2006, directing the secretary of defense to develop capabilities, plans, and options to guarantee American freedom of action in space and to develop the ability to deny such freedom of action to other countries. This directive was a green light for the development and use of satellite weapons, but little concrete action was taken to actually weaponize space. Following his inauguration, President Barack Obama—in a reversal of George W. Bush's focus on securing U.S. dominance in space—has followed a policy of emphasizing international cooperation in an effort to reduce tensions surrounding military space issues. As of 2012, his administration was working with the European Union and other spacefaring nations to develop an International Code of Conduct to regulate all space-based military activities.

WEINBERGER-POWELL DOCTRINE

The Weinberger-Powell Doctrine lays out a series of considerations to be weighed before the deployment of U.S. combat forces abroad. Six criteria were first delineated by the then secretary of defense Caspar W. Weinberger in a 1984 speech to the National Press Club:

1. U.S. force should be employed only in cases “vital to our national interest or that of our allies.”
2. Troops should be committed “wholeheartedly and with the clear intention of winning.”
3. There should be “clearly defined political and military objectives.”
4. There should be a proper, and continually reassessed, “relationship between our objectives and the forces we have committed—their size, composition, and disposition.”
5. There should be “some reasonable assurance we will have the support of the American people and their elected representatives in Congress.”
6. Use of force should “be a last resort.”

At the time of the Persian Gulf War in 1990–1991, Colin Powell, an adviser to Weinberger in 1984 who had subsequently risen to be chairman of the Joint Chiefs of Staff, reinforced Weinberger's points with a particular focus on having overwhelming U.S. forces to win quick and decisive victories. Powell also added the idea of having a clear exit strategy in mind before beginning a new conflict so as to avoid endless entanglements. The doctrine had major influence during the Reagan, George H. W. Bush, and Clinton administrations when policymakers considered the use of force in Central America, the Balkans, Somalia, Rwanda, and elsewhere. The doctrine always had critics who argued that it was too restrictive; in the later Clinton years, it gradually was set aside to allow for more humanitarian interventions. It was fully rejected by the then secretary of defense Donald Rumsfeld and others in the George W. Bush administration.

Many of the doctrine's ideas originated in the military's study of and perceived lessons from the Vietnam War. More immediately, following the October 1983 bombing of a marine barracks in Beirut, Secretary of State George Shultz spoke about the importance of avoiding paralyzing self-doubt and hesitation in the use of U.S. forces. In response, Weinberger's speech sought to publicly establish the military's belief that, while the use of force was still crucial in preserving modern U.S. interests, its indiscriminate and regular use without full domestic support was a threat to the fabric of society and to democratic consensus. Powell's views were also deeply shaped by the Vietnam War and by his time around civilian leaders in the Reagan White House. Consequently, in discussions leading to the Persian Gulf War, he insisted on employing Weinberger's criteria. This quick and domestically popular war

reinforced many military leaders' belief that they had learned the right lessons from the Vietnam War and other experiences.

Supporters of the doctrine argue that it allows the United States to use force where appropriate, but to avoid poorly defined missions and Vietnam-like quagmires. It also enhances the military's influence in the use of force in decision making and reminds civilian politicians of the gravity of their decisions. The military is thus recast as a hesitant, thoughtful defender of national interests, not as an aggressive institution pushing for war on every occasion. The focus on requiring public and congressional support is seen as reinforcing checks in the political process and thus reducing the excessive power of the "imperial presidency."

Critics of the doctrine include academics, some military analysts, and a number of prominent U.S. diplomats, such as secretaries of state Shultz and Madeleine Albright and secretaries of defense James Schlesinger and Les Aspin. They argue that the collective requirements are so restrictive that the doctrine leads the country to a policy of appeasement. It also reduces U.S. global influence by reinforcing the idea that, after Vietnam, the country has become a paper tiger unwilling to back its commitments or to accept its responsibilities for maintaining global order if there is a high risk of casualties. The critics also suggest that the doctrine's all-or-nothing approach and "war as a last resort" concepts would limit the diplomatic effectiveness of U.S. threats to employ force.

Concerns also are raised about a number of the specific criteria. The idea that force should only be used for vital interests is seen by some as overly flexible, since most presidents contemplating force would define their goals as being vital. On the other hand, limiting force to only vital interests might exclude times when the United States would want to use force early in a crisis or to demonstrate credibility. Depending on the definition of vital interest, it might also severely constrain humanitarian interventions, efforts to spread democracy, or other value-based uses of force. The concept of commitment to clear victory and pursuing defined goals could be constraining if goals shifted as events unfolded. The insistence on public support might exaggerate the degree of popular support necessary to sustain short operations and delay a timely response when swift action was needed. More important, it might put sometimes ill-informed public opinion above the

considered opinion of the president in determining when the use of force was necessary. The focus on overwhelming force is challenged by those who feel that technological changes have shifted the advantage to small, fast, and technologically advanced forces.

By the time the Iraq War began in 2003, the doctrine had been largely discarded, despite the fact that Powell was then serving as secretary of state. However, the duration and political and military complications of the wars in Iraq and Afghanistan may bring a revival of interest in the Weinberger-Powell Doctrine.

WHISTLE-BLOWING

Whistle-blowing occurs when a member of an organization discloses information regarding immoral and often illegal practices taking place within the organization. Whistle-blowers may make reports to authorities either within the organization (internal whistle-blowing—e.g., to internal auditors) or to individuals or entities outside the organization (external whistle-blowing—e.g., to the media or auditing agencies). Whistle-blowing may be considered a form of prosocial or organizational citizenship behavior that ultimately benefits others as well as organizational integrity. However, whistle-blowers are often subject to acts of retaliation (e.g., employer/coworker reprisal, public criticism,

termination), which destroys reputations and careers, despite a patchwork of federal and state legislation that is meant to offer protection.

Research suggests that several demographic and personality variables are associated with whistle-blowing behavior. According to a recent meta-analysis by Jessica Mesmer-Magnus and Chockalingam Viswesvaran, the typical whistle-blower tends to be male, has a higher level of education, has good job performance, holds an upper level or supervisory position, and elicits higher scores on moral reasoning tests. Age and tenure do not appear to be associated with whistle-blowing behavior. In comparison with personality traits, contextual variables seem to be better predictors of whistle-blowing judgments. For example, when the threat of retaliation is low and when whistle-blowing is seen as a valued action within the job or organizational context, individuals are significantly more likely to report incidents of wrongdoing. Janet Near and Marcia Miceli have reported that other contextual data, like the perceived severity of the violation, the nature of the evidence for the transgression, likability of the violator(s), and whether the observer is personally affected by the wrongdoing, influence whistle-blowing decisions.

Instances of Whistle-Blowing Within the U.S. Government and Armed Forces

Dr. Frederic Whitehurst (1998)

The Federal Bureau of Investigation's crime lab underwent great scrutiny in the mid- to late 1990s when a Federal Bureau of Investigation chemist, Dr. Frederic Whitehurst, revealed serious flaws in lab investigation and reporting practices. At the time of his public disclosure, Whitehurst was considered the agency's top bomb residue expert, but he was subsequently transferred, or demoted, to another unit. Whitehurst later filed a suit for the losses he suffered as the result of an early resignation; a settlement was eventually reached in excess of \$1 million for illegal retaliation (a violation of the Whistleblower Protection Act [WPA]). Whitehurst won a second lawsuit filed under the Privacy Act for harm to his reputation and was awarded an additional \$300,000. Following the suit, Whitehurst became the executive director of the National Whistleblower Center's Forensic Justice Project, which reviews the scientific work and integrity of

multiple forensic labs, including that of the Federal Bureau of Investigation.

Sergeant Joseph Darby (2004)

In 2004, Army Specialist Sergeant Joseph Darby blew the whistle to military investigators regarding alleged instances of illegal abusive treatment and torture of prisoners by U.S. military personnel at the Abu Ghraib prison in Iraq. According to the 2004 Fay and Jones report, Darby provided undeniable evidence (in the form of compact discs of digital photographs and detailed information) of (a) intentional violent or sexual abuse and (b) abusive behavior that resulted from misconceptions regarding U.S. laws and international policies regarding the treatment of detainees. While Darby's information resulted in the prosecution and punishment of the involved military personnel, his confidentiality was breached. As a result, Darby faced extensive retaliation from the public, colleagues, and family members (i.e., accusations of treasons, death threats, condemnation), forcing him into protective custody.

Ceballos v. Garcetti (2002)

In the year 2000, Richard Ceballos, a deputy district attorney in the Los Angeles County district attorney's office, submitted a disposition memorandum in a criminal trial expressing concern for the validity of information included in an affidavit used to obtain a search warrant. He was subsequently demoted and filed allegations of retaliation, claiming that the memorandum was protected under the First Amendment. The case was eventually turned over to the Supreme Court, where it was ruled that because Ceballos was a government employee and was speaking in accordance with his professional obligations, not as a private citizen, the memo he gave was simply the voice of his employer and was therefore (a) not protected under the First Amendment's right to free speech and (b) not protected from acts of retaliation.

MacLean v. DHS (2008)

In 2003, the Department of Homeland Security's Transportation Security Administration (TSA) faced accusations from whistle-blower and former federal air marshal Robert MacLean. According to *MacLean v. DHS*, MacLean revealed to the media TSA's plan to terminate the use of federal air marshals during

prolonged flights not long after a heightened terror alert was issued. MacLean's disclosure resulted in extensive media and congressional investigation into the integrity of the TSA's decisions. In 2006, the TSA terminated MacLean on the basis of Sensitive Security Information disclosure. Maclean's petition for reinstatement under the WPA was denied under a ruling that said he did in fact leak Sensitive Security Information and that TSA's termination decision was not in violation of the act.

Without question, individuals who choose to expose negligence, fraud, or abuse within an organization often face risk of retaliation and reprisal. Sometimes, when anonymity is ensured, the negative consequences associated with whistle-blowing can be avoided. However, as seen in Darby's case, there is not always a guarantee of anonymity. Nationwide estimates suggest that approximately one third of U.S. employees have observed unethical and/or illegal practices within their organizations, but more than half of these instances go unreported. Undoubtedly, many of these observers consider the risk of blowing the whistle too great because of the potential damage to their reputation and career should their identities be revealed. Authors Joyce Rothschild and Terance Miethe explain that although internal whistle-blowing appears to elicit a lesser degree of organizational retaliation than does external whistle-blowing, regardless of the reporting avenue they select, whistle-blowers still face the potential for termination, forced resignation, poor performance evaluations, micromanagement, criticism and ostracism by coworkers, and tarnished reputations, as well as potential consequences in their personal lives, including depression, inability to trust, family and marital problems, financial loss, and decline in physical health. Research suggests that the potential for such negative outcomes is greater for lower level and nonmanagerial employees, minorities, and external reporters.

Whistle-Blower Protection Legislation

The False Claims Act

The False Claims Act, also known as the "Lincoln Law," was enacted in the late 1800s as a means of protecting the government against fraudulent contracting. This was the first federal law to permit private individuals to file suit on behalf of the U.S. government and was the first to promote

whistle-blowing behavior through the provision of monetary rewards. Whistle-blowers were granted up to 50% of damages/recovered money under this legislation, although a 1943 amendment to this act decreased the award maximum to 25%. A 1986 amendment to the False Claims Act increased penalties for fraudulent conduct and provided legal protection for whistle-blowers against retaliation from employers. In 2009, the False Claims Act was once more transformed by the Fraud Enforcement and Recovery Act, which deleted the prior requirement that reports of false claims must be made to a federal officer or employee.

Civil Service Reform Act

The Civil Service Reform Act of 1978 was the first piece of federal legislation to provide legal protection to government employees who blow the whistle on breaches in federal regulations and instances of corruption. The act established both the Office of Special Counsel and the U.S. Merit System Protection Board, the latter of which handles appeals of federal employees claiming employer retaliation after blowing the whistle. Cases involving retaliation against whistle-blowers could now be presented to the Merit System Protection Board through the Office of Special Counsel.

Whistleblower Protection Act

The WPA of 1989 was passed to strengthen laws protecting government-employed whistle-blowers. Under the WPA, reprisal against federal employees is specifically barred as long as whistle-blowers report transgressions they reasonably believe to be in violation of some federal regulation. Furthermore, this legislation extends to whistle-blowers reporting to external entities. Other provisions of this act include (a) less stringent requirements associated with the burden of proof placed on the whistle-blower during the appeals process and (b) no longer mandating whistle-blowers to solicit the Office of Special Counsel's help prior to filing an appeal with the Merit System Protection Board. Recently proposed revisions to the WPA (the Whistleblower Protection Enhancement Acts of 2007 and 2009) would extend protection to federal employees whose duties fall under matters of national security or whose disclosures are considered part of their professional obligations.

Military Whistleblower Protection Act

The Military Whistleblower Protection Act of 1988 prohibits retaliation against military whistle-blowers exposing government or defense-related wrongdoing to any member of Congress or the inspector general for the U.S. Department of Defense. This act was later amended to include protection for individuals who report such wrongdoings to Department of Defense officers, criminal investigators, auditors, and inspectors, and to prohibit the implementation of mental health evaluations during employee performance reviews as a means of reprisal.

Sarbanes-Oxley Act

The Sarbanes-Oxley Act of 2002 is one of the most well-known sets of laws offering protection to private sector whistle-blowers reporting accounts of federal fraud or breaches in securities regulations. The act was prompted by the Enron scandal in which executives used misleading financial reports to hide billions of dollars of debt. It was designed as a means of protecting investors in public companies and includes protection for whistle-blowers from employer retaliation on exposure of fraudulent and unethical behavior within a public company, particularly when the whistle-blower uncovers violations of Securities and Exchange Commission (SEC) regulations. In the event that an individual experiences retaliation under these circumstances, as determined by the court, an order for relief will be mandated that can include reinstatement with prior-held seniority status, back pay with interest, and compensation for other damages, including trial-related fees. The Sarbanes-Oxley Act requires public companies to provide safe avenues for employees to report fraudulent behavior and provides for both individual and corporate legal responsibility for acts of reprisal and increased criminal penalties under such circumstances.

Dodd-Frank Wall Street Reform and Consumer Protection Act

The 2010 Dodd-Frank Act extends the Sarbanes-Oxley Act to cover all employees, not just those of public companies. It expands the protection of whistle-blowers' confidentiality and guards against reprisal as a result of whistle-blowers' lawful actions, such as reporting violations of securities laws to the SEC and participating in investigative action related to transgressions by the request of the

SEC or a court. Also under this act, whistle-blowers are (a) permitted to take claims directly to their federal district court, rather than first making reports to intermediaries such as the Occupational Safety and Health Administration, and (b) offered financial incentive to blow the whistle on financial fraud against the government. (The SEC is now required to dole out 10% to 30% of any sanction assessed that exceeds \$1 million, provided that the whistle-blower contributed original information resulting in a settlement or recovered funds.)

Despite the strengthening of whistle-blower protection through recent legislation, there still remains a stigma associated with whistle-blowers. Authors Janet Near and Marcia Miceli maintain that although a whistle-blower offers an organization the opportunity to improve the ethicality and social responsibility of its practices and procedures, many still assume that the criticism of whistle-blowers is nothing more than "sour grapes" from employees with a grudge against their employer. Continued research is needed to understand how effective whistle-blowing might be promoted and appropriately responded to within organizations.

WHITE HOUSE MILITARY OFFICE

The White House Military Office (WHMO) is visible to the public when the president travels abroad, when foreign visitors come to the White House, and when Camp David is used as a retreat or for policy functions. These activities are carried out by what is known as the WHMO. Its role is to provide military support for White House functions, including food supervision, transportation, Marine One and Air Force One, medical support and emergency care, hospitality, and keeping the trigger of the strategic nuclear attack force with the president at all times. The director of WHMO is primarily responsible for military operations aboard Air Force One during presidential travel. The WHMO is an aggregate of functions that accrued over time, but there is no one clear mission statement.

History and Overview

The WHMO derives its legitimacy and range of functions from the relationship of a military aide-de-camp to the chief executive. This model encompasses all activities dealing with the direct protection and comfort of the president and his work as a military responsibility. From George Washington to Franklin D. Roosevelt, the needs of each executive were met in an improvised, varied, and ad hoc manner. Under Roosevelt, a number of previously

temporary needs coalesced into full-time functions for the White House Office.

WHMO's responsibilities have evolved over the past 70 years as duties increased from one or two military functions to serving the president's house-keeping needs, to an aggregation of services organized under the framework of presidential logistics, security, and protection. These functions range from military command issues to ceremonial duties and include military operations on Air Force One, transportation on Marine One, food service at Camp David, garage access at the White House, and medical care for White House personnel, among others. From its inception, its purpose was to aid the president in managing the many details related to the functions of the office. Over the years, ad hoc efforts became more systematized and led to the creation of a bureaucratic structure. Two major management reform efforts were undertaken: The first under the Carter presidency, and another at the end of the Reagan administration.

Creation of a Bureaucracy

Roosevelt created a new divisional structure for the executive office by Executive Order 8248 in 1939. The White House Office was one of four new offices created to organize and simplify executive activities to ensure the good functioning of the presidency. It consisted of three subdivisions: (1) the secretaries to the president, (2) an executive clerk for all documents and reports, and (3) administrative aides who were to act as personal aides to the president and his public functions. The White House Office was enacted to be the president's manager regarding the many household details involving the president and his office.

Camp Shangri-La, later renamed Camp David, developed as a presidential retreat, and was incorporated into the WHMO in 1942. Shortly thereafter, the need for secure and accurate communication led to the creation of the White House Communication Agency. In 1944, Roosevelt requested a White House pilot. This office is now known as the Presidential Airlift Group. A White House Medical Unit was set up in 1945. The White House Mess, established in 1951, is now known as the Presidential Food Service and is run by the navy. In 1957, Dwight Eisenhower's use of helicopters for short trips created Marine Helicopter Squadron One.

As the White House's technology and security needs increased, functions were added to the WHMO, and actions initiated in the 1940s took on a more sophisticated structure. John F. Kennedy was the first president to fly in jets; he was also the first president to become attached to the "Presidential football," a phrase applied to the nuclear briefcase and its constant proximity to the president, carried by a military aide. The White House Garage, initiated in 1913, became the White House Transportation Agency in 1963, and was placed within the WHMO during the Carter reorganization. The office includes support elements such as (a) operations; (b) policy, plans, and requirements; (c) administration and information resource management; (d) financial management comptroller; (e) WHMO counsel; and (f) security.

Reorganization

The Carter administration was the first presidential administration to try to tame the increasingly chaotic functions developed in the WHMO. The reorganization highlighted two separate functions, one focused on White House activities and the other related to the executive office of the president. These changes were codified in Executive Order 12028: "The primary responsibility for performing all administrative support and service functions of units within the Executive Office of the President shall be transferred and reassigned to the Office of Administration." In 1987, Reagan sought to further clarify the functions through Executive Order 12608. The changes occurred under the George H. W. Bush administration when all functions were brought under the Office of Management and Administration, reporting to the White House chief of staff.

The present structure places WHMO under the direct purview of the Office of Management and Administration, which supervises all White House activities. The director of the Office of Management and Administration is an appointment made by the president. The WHMO has a deputy assistant to the president and the director of Office of Management and Administration. All members of the WHMO are Department of Defense personnel, funded by that agency, but serving the executive and the White House. They are career personnel who may not have any personal connection to the president but are responsible for many of the president's personal needs.

WOMEN

In the United States, women have participated in every military conflict since the colonial period. However, women did not become part of the armed forces until the 20th century. Instead, women's war service consisted primarily of traveling with militaries to support husbands or male family members in service, volunteering with civilian organizations, or performing nursing care services. Beginning in 1901, the United States began to allow women to serve in more formal roles, beginning with the formation of nursing corps and eventually with the full admission of women to the armed forces on a permanent basis in 1948. This entry offers a brief history of (a) women's participation with and in the U.S. military, (b) the transition of women's service from traditional to nontraditional roles, (c) a comparative look at women in militaries in other nations, and (d) an overview of women's roles in the U.S. military in the early 21st century.

Camp Followers and Volunteers: The 18th and 19th Centuries

During the American war for independence, many women followed their soldier-husbands to the front lines. Known as "camp followers," these women provided support for their husbands by cooking food, doing laundry, and handling other similar tasks, including nursing. In some instances, these women also offered these services to other men who may not have had wives available to perform such tasks.

One of the most famous camp followers was Mary Ludwig Hays McCaulay, the wife of a private. During the Battle of Monmouth in 1778, McCaulay earned the nickname Molly Pitcher because she served water to her husband and other soldiers during battle. She became even more famous, however, because after her husband was wounded, she took

his place at the cannon and acted as rammer for the remainder of the battle to make sure that the cannon continued to fire.

In the 19th century, some women disguised themselves as men to serve in the military. Lucy Brewer is recognized as the first woman in the U.S. Marines because she passed herself off as a man and served on the USS *Constitution* during the War of 1812, although some believe that the story is primarily a myth. In the Civil War from 1861 to 1865, perhaps hundreds of women fought for both the Confederacy and the Union by cross-dressing and pretending to be young men.

Over the course of the 19th century, however, nursing became the war support role most associated with women. More than 2,000 women, including the author Louisa Alcott, volunteered as nurses in military hospitals during the Civil War. While Clara Barton is perhaps best known for her efforts during the war and her later establishment of the Red Cross, Dorothea Dix worked specifically to recruit women through the Army Medical Bureau. Although these nurses did not have formal military status, Dix became the Superintendent of Female Army Nurses and helped the army with its efforts to recruit female nurses.

From Military Nurses to Yeomanettes: The Early 20th Century

In the Spanish-American War (1898–1901), women nurses continued to play an important part in providing medical care to wounded soldiers. More than 1,500 women served in the United States, in war zones, and on hospital ships to care for soldiers. The military continued to classify these women as civilian workers. These nurses worked alongside the armed forces and in military facilities but were not eligible for military or veteran benefits.

Women's indispensable nursing support during the Spanish-American War led to the creation of the Army Nurse Corps in 1901. The Army Nurse Corps provided a permanent place for women nurses as members of the military for the first time. In 1908, the navy followed suit and created the Navy Nurse Corps to ensure they had similar support in wartime.

By the time the United States entered World War I in 1917, both the army and the navy had several thousand nurses. The army had slightly more than 4,000 nurses in their ranks in 1917, and by 1918, this number exceeded 20,000. More than 1,500 nurses

A group shot of yeomanettes from the Supply Department, U.S. Navy Yard, Mare Island, California, ca. 1918.

served in the Navy Nurse Corps during the war. In both organizations, women served in the United States and abroad, as well as on hospital ships.

Outside of the Nurse Corps, the navy and the Marine Corps admitted more than 13,000 women to serve during World War I. These women, classified as Yeoman (F) and Marine (F) to indicate that they were female, quickly became known as yeomanettes and marinettes. Only several hundred women served in the army with the Signal Corps, and small numbers of women also joined the Coast Guard during World War I.

The Turning Point: World War II

When the United States entered World War II in 1941, however, women's military service began to change forever. In addition to the Army Nurse Corps and Navy Nurse Corps, the army established

the Women's Army Auxiliary Corps through a 1942 act of Congress, allowing nonmedical female personnel to serve as auxiliaries to the army. A year later, new legislation converted the Women's Army Auxiliary Corps to the Women's Army Corps, granting the Women's Army Corps full military status like women in the Nurse Corps. The navy, Marine Corps, and Coast Guard admitted women under reserve status, granting them the full benefits that male service members received.

Between 1941 and 1945, approximately 400,000 women served in all military branches. While the majority of servicewomen were stationed in the United States, thousands served in North Africa, Europe, and the Pacific. Although the army initially anticipated that women could fill only five jobs, by the war's end, women throughout the military performed a number of roles in addition to their traditional ones as nurses. World War II servicewomen

Women workers install fixtures and assemblies to a tail fuselage section of a B-17 bomber at the Douglas Aircraft Company plant, Long Beach, California. Better known as the “Flying Fortress,” the B-17F is a later model of the B-17, which distinguished itself in action in the South Pacific, Germany, and elsewhere. It is a long-range, high-altitude heavy bomber, with a crew of seven to nine men, and with armament sufficient to defend itself on daylight missions.

worked as clerks, cooks, supply sergeants, mechanics, photographers, and held roles in nearly all fields, including intelligence and cryptography. Because total war called for effective personnel utilization, only a few roles remained closed to women by 1945.

In addition to the women who served within military branches, the Women Airforce Service Pilots (WASPs) consisted of a number of civilian women pilots. The WASPs, recognized in 2010 for their service to the nation in World War II, ferried planes from factories to military bases in the continental United States and Canada, trained male pilots, participated in night exercises, tested experimental aircraft, performed airplane maintenance, and provided other support. In 1977, Congress

granted former WASPs veteran status, and in 2010, President Barack Obama recognized WASPs with the Congressional Gold Medal.

Toward Full Integration: Women in the Cold War Military

By the end of World War II, the military reached a turning point with its utilization of women. Because of women’s indispensable participation in World War II, the services approached Congress with legislation that would make women a permanent part of the military. Previously, the legislation passed in World War II provided that the wartime women’s services (apart from the nursing corps) would be

dissolved 6 months after the war's end. However, prominent military leaders like General Dwight Eisenhower convinced Congress that the military needed women. If there was another war, the services argued, there would not be time to start again to re-create the women's service components.

The Women's Armed Services Integration Act of 1948 (Public Law 80-625) established women's military roles in the postwar era. According to this law, up to 2% of the total military strength could be made up of women in the army, the navy, the Marine Corps, and the new air force. The law stated that women in the navy, Marine Corps, and air force could not serve on ships or in planes, with the exception of hospital ships or transport craft. According to the law, women could not have any dependents under the age of 18 and could be discharged from the military at any time, a provision designed to make it easy to discharge women who became pregnant. Women who had never served in the military before had to be unmarried to enlist or to accept an officer's commission, but women could marry once they were in the military. The law did not say anything about which jobs women would perform but stipulated that women could not serve in combat roles.

When the Korean War began in 1950, the services made their first efforts to recruit women in large numbers but never hit their target recruitment numbers. In 1951, the Department of Defense created the Defense Advisory Committee on Women in the Services to help find ways to recruit and retain women. This committee, which comprises female civilian leaders from communities all around the nation, focused its efforts on publicizing opportunities for women in military service and helping the branches improve their ability to recruit women. In addition, this committee would advise the Department of Defense on ways to improve retention.

In the 1950s and 1960s, servicewomen primarily held traditional roles in all the branches. Most women outside of the Nurse Corps were concentrated in clerical jobs and personnel administration. Recruiting remained difficult, although the services focused on emphasizing femininity, equal pay, job training, and travel as some of the benefits of military service for women in particular.

Legal limitations on servicewomen also remained tight in these decades. In the 1950s, President Truman passed Executive Order 10240, which clarified that women with children could not serve in

the military. Although Public Law 80-625 said that women could only make up 2% of the nation's military strength, during these decades, women did not even usually reach 1% of the total military strength.

One of the most problematic Public Law 80-625 restrictions, however, was that women could not advance beyond the permanent rank of lieutenant colonel (in the army, air force, and Marine Corps) or commander (in the navy). Each of the women's service components could have one woman serving as colonel or captain—the director of each component. When that woman stepped down, however, she kept a permanent rank as lieutenant colonel or commander. This meant that women officers could not advance more than halfway up the officer grade scale.

In 1967, Congress passed legislation that remedied this problem. Public Law 90-130 removed this restriction and allowed women officers to be promoted to any rank, including general or admiral. This law represented another major turning point in women's military service opportunities. In 1969, the air force became the first branch to allow women in the Reserve Officers' Training Corps (ROTC) program. Although that branch experimented with a women's ROTC program in the 1950s, that program was short lived. The new admission of women to ROTC in 1969 led to all branches admitting women to ROTC by the mid-1970s.

The 1970s brought even bigger changes. When the draft ended in 1973, the military began to reassess its utilization of women. The presence of the women's movement in American society also helped servicewomen as they began to argue for equal opportunity and equality in the military. During the 1970s, all the service branches modified their regulations about mothers in service; by the middle of the decade, women could remain in service after having children. All the branches also began to expand women's job opportunities, and women received access to more than 95% of all military occupational specialties. The only exclusions were those in combat and combat support roles. In 1976, Congress authorized women to enroll in West Point, the United States Air Force Academy, and the United States Naval Academy. Finally, in 1978, Congress revised Title 10 of the U.S. Code to permit women to serve on ships and in airplanes.

In the 1980s, women continued to move into nontraditional military career fields and to serve

in even more locations worldwide. The military deployed women to Grenada and Panama, and the percentage of women in the U.S. military grew to more than 11%. Efforts to extend the draft registration system to include women failed, however.

International Militaries

The United States was not the only country to incorporate women into its defense system during and after World War II. In fact, British actions preceded American efforts to incorporate women; World War II officers such as Colonel Mary Hallaren looked to the United Kingdom's military system at the end of World War II as a model for how women might be incorporated in to the U.S. military. The United Kingdom also made women's service permanent at the end of World War II. As in the United States, British women's military roles began to move closer to combat in the 1990s. According to 2006 statistics from the UK Ministry of Defence, women account for about 9% of all British military personnel. Although they may serve on ships and in combat zones, they do not engage in direct combat.

The Soviet Union allowed women to fly in combat during World War II and utilized women in combat roles in both the World Wars. During the Cold War, Soviet legislation required that women be drafted during wartime only and subjected women to military training programs as part of their early education. Russia continued to utilize women after the end of the Cold War. By the end of the 20th century, women were 10% of the Russian armed forces. Although Russian servicewomen can hold nearly any position in the military, most servicewomen remain in fields such as clerical work, communications, and medicine.

In Israel, the draft applies to both men and women, although some women gain exemptions for religious reasons. In 1995, the Israel Defense Forces began to allow women to train in their flight programs. Approximately one third of all Israel Defense Forces personnel are women, and women may participate in nearly 90% of all jobs. Combat roles are voluntary.

During the second half of the 20th century, many countries around the world began to admit women into their armed forces, including Canada (1951), West Germany (1975), Norway (1977), the Netherlands (1979), and Spain (1988). A number of other countries also draft women into military

service, including North Korea, Taiwan, Egypt, Peru, Tunisia, Malaysia, and Eritrea.

U.S. Women in the Military Since 1991

Operation Desert Storm in 1991 marked another turning point in women's military participation in the United States. Following the Persian Gulf War, Congress reversed the limitations in U.S. Code Title 10 against women in combat. This meant that women could now serve in combat and combat support roles and that there were no more legal limitations against women in such capacities. However, as Congress revised Title 10, the services enacted new policies that continued to approach the issue of women in combat roles conservatively.

Issues of sexual harassment in the military began to emerge in the 1990s as well, particularly with news of the Tailhook scandal in 1991. This occurrence at the annual conference of the Tailhook Association, a private organization of active, reserve, and retired navy and Marine Corps personnel (primarily those associated with aircraft carriers and naval aviation), brought new, widespread attention to the issue of sexual harassment within the military. During the conference, a number of female officers became the victims of sexual abuse that occurred in connection with extensive drinking. Although prior to this the service branches had worked toward rape and sexual assault prevention efforts, it was not until 2005 that the Department of Defense initiated its first uniform sexual assault and prevention policy (DOD Directive 6495.01, Sexual Assault Prevention and Response Policy). Along with that policy, the Sexual Assault Prevention and Response Office was established to oversee compliance with this policy.

In 1993, the instatement of Public Law 103-160 (Title 10, Section 654, commonly known as "Don't Ask, Don't Tell") initiated a new period in which homosexual service members could maintain their military status by hiding their homosexuality. By 2008, however, data showed that women were discharged in disproportionate numbers under this law. Nearly one third of all discharges under this law in 2008 were of women, although women made up approximately 15% of the total military strength at that time.

U.S. military involvement in the Middle East under Operation Iraqi Freedom and Operation Enduring Freedom (Afghanistan) continues to give women new opportunities to expand into a number of new roles. Although policy still excluded women

from the infantry and other combat branches, many American servicewomen stationed in Iraq and Afghanistan found themselves participating in combat activities. Eleven percent of all personnel in the Iraq and Afghanistan theaters by late 2009 were female. In 2008, General Ann Dunwoody (U.S. Army) became the first woman promoted to four-star general, followed by General Janet Wolfenbarger (U.S. Air Force) in 2012.

In 2010, the navy announced plans to allow women on submarines for the first time beginning in 2011. Eleven 2010 United States Naval Academy graduates volunteered for submarine duty and were announced as the first women to be selected for this role. Additional volunteers were to come from ROTC and officer candidate schools nationwide.

Additionally, the expansion of women's roles into combat zones and combat activities led to greater awareness about (a) how such participation affects women's bodies, (b) the need for more women's care in the Veterans Administration system, and (c) the effect of posttraumatic stress disorder on women. Concerns over women and pregnancy in war zones became particularly prominent in late 2009 when

Major General Anthony Cucolo announced that women under his command in Iraq could be subject to discharge for becoming pregnant, a violation of policies against sexual activity in war zones. Although his superiors quickly reversed his command, the incident heightened awareness of concerns over women in combat.

Although women have been a permanent part of the military since the middle of the 20th century, gender-based restrictions often kept women in "traditional" roles such as nursing and clerical or administrative positions and out of combat. For most of the 20th century, women made up less than 2% of the nation's total military strength. This percentage began to increase following the end of the draft in 1973, and by 2012, the Department of Defense estimated that women comprised approximately 15% of total military personnel.

Only in the late 20th and early 21st centuries did women begin to serve as nonmedical personnel in combat zones. Combat exclusion policies, primarily those restricting women from the combat branches, continued to exist as of early 2013. However, in January 2013, Secretary of Defense Leon Panetta and

U.S. Army Lieutenant General Ann E. Dunwoody (center) smiles as chief of staff of the army General George W. Casey (left) and her husband, Craig Brotchie, pin the rank of general on her during her promotion ceremony in the Pentagon on November 14, 2008. Dunwoody is the first female in the U.S. military to achieve the rank of four-star general.

Chairman of the Joint Chiefs of Staff Martin Dempsey announced that all combat exclusion policies would be eliminated, including the 1994 Direct Ground Combat Definition and Assignment Rule and other policies that prevented women from roles in combat branches. Full implementation of the new policy is expected by January 1, 2016. Military branches may request exceptions for specific combat roles, but such requests require data to support the need for such exceptions and may only be approved by the Chairman of the Joint Chiefs of Staff and Secretary of Defense.

While the 2013 policy signaled a significant shift in women's military roles, 2013 also saw renewed attention to concerns over military sexual assault and harassment. The officer in charge of the air force's sexual assault prevention program was arrested on sexual assault charges. An unrelated but similar case

involving an army sergeant who served in a sexual assault prevention and response coordination role led to a formal inquiry. At West Point, charges also came against a sergeant who had secretly videotaped and photographed female cadets. In response to these and other concerns, including new data showing a growth in military sexual assault, Secretary of Defense Chuck Hagel announced a number of new efforts to try to eliminate military sexual assault and change the over-all culture toward sexual assault in the armed forces.

Franz Ferdinand in Sarajevo as a pretext for securing greater territorial, military, and economic strength at the expense of their rivals. With the Central Powers of Germany, Austria-Hungary, and the Ottoman Empire squaring off against more than 20 Entente nations (also known as the Allies) led by Britain, France, and Russia, U.S. president Woodrow Wilson made a decision to stay neutral. Neutrality proved difficult to maintain, and for 2½ years the United States found itself embroiled in a series of diplomatic crises that gradually edged the nation nearer to war.

Causes for America's Entry

With their armies locked in a stalemate along the Western Front in 1915, both Britain and Germany tried to gain the advantage by using their navies to disrupt the trade of their enemy. The British established a blockade that included mining the North Sea, while Germany turned to its new weapon, the U-boat or submarine, to launch surprise attacks against merchant and military vessels. Both tactics met with protest from the United States, but the British proved much more successful than Germany in resolving disagreements with the United States through diplomatic channels. In response, for example, to U.S. complaints when Britain added cotton to the contraband list, Britain agreed to buy excess American cotton to stabilize the price. The British blockade did not disrupt the Americans' traditional trading route through the English Channel and consequently trade with Britain (the nation's largest prewar trading partner) boomed. This trading relationship received another boost in January 1915 when the financial giant JPMorgan became the purchasing and contracting agent for the British government within the United States. Over the next 2 years, the House of Morgan worked closely with British military and financial officials to award more than 4,000 contracts worth more than \$3 billion to American businesses. In addition, American bankers extended commercial credit to the Allies that averaged nearly \$10 million a day. By 1916, American trade with Germany was less than 1% of what it had been in 1914, but trade with Britain and France had tripled.

Germany's decision to erect a submarine blockade around British waters proved more contentious. Wilson protested that unconditional submarine warfare (which relied on undetected U-boats firing

WORLD WAR I

torpedoes) denied civilian passengers the internationally sanctioned right to vacate a merchant ship before its cargo was sunk. On May 7, 1915, a torpedo fired by a German U-boat sank the *Lusitania*, a British passenger ship that also carried munitions, and killed 1,198 passengers, including 127 Americans. In the wake of the sinking, Wilson demanded that Germany pay reparations and accept the right of Americans to travel on any ship they wished. Secretary of State William Jennings Bryan disagreed and, instead, urged Wilson to order Americans to stay off ships headed to the war zone. Bryan soon resigned in protest, and his successor Robert Lansing consistently advised Wilson to take decisive action in response to German provocations. Faced with deteriorating relations with the United States, two other controversial torpedoings eventually convinced Germany to temporarily halt surprise attacks on merchant and passenger ships. In the *Arabic* Pledge on September 1, 1915, Germany agreed to stop firing on passenger ships without warning, and in the *Sussex* Pledge on May 4, 1916,

it promised to refrain from attacking unarmed merchant ships until the crew and passengers could vacate the vessel.

Strong financial ties did not guarantee a trouble-free relationship between Britain and the United States, however. As tension between Germany and the United States eased, U.S.-British relations deteriorated in the wake of Britain's decision to blacklist American firms that traded with Germany and Britain's violent suppression of the 1916 Irish Easter Rebellion. Perhaps more important, a credit crisis loomed that threatened to cut off Britain's access to American goods and financing. The British had exhausted their capacity to borrow money against secured assets, and the Federal Reserve cautioned U.S. bankers against making unsecured loans.

Unaware that collapsing finances might soon stop the flow of U.S. goods to Britain, Germany resolved to reignite unconditional submarine warfare to accomplish the same goal. German officials reasoned that their now substantial fleet of U-boats could sink enough Allied shipping fast enough to

win the war before the Americans could make any difference along the Western Front. In preparation for the January 31, 1917, announcement that Germany would resume unconditional submarine warfare, German foreign minister Arthur Zimmermann attempted to take advantage of the Americans' recent conflicts with the Mexican government. Mexico had objected strenuously when U.S. troops invaded Mexico in 1916 to stop rebel raids along the border; after nearly coming to blows with the Mexican army, American troops withdrew in January 1917. Striking while the iron was hot, Zimmermann sent his famous telegram promising Mexico territorial concessions if it attacked the United States and Germany won the war. In one of the war's great intelligence victories, British agents intercepted and decoded the telegram. They then turned it over to Wilson who made its contents public in March, the same month that Americans began dying when German U-boats sank three American merchant ships.

America Enters the War

With Germany now posing a tangible physical danger to the nation's territorial and economic security, Wilson asked Congress for a declaration of war. On April 6, 1917, the United States declared war on Germany. It did not declare war on Austria-Hungary until December 1917 and was never at war with the Ottoman Empire. In declaring war, Wilson saw a potential opportunity to reshape international relations so that a permanent peace could reign. Dedicated to creating a league of nations that could foster self-determination and free trade, Wilson hoped that a major contribution by American troops on the battlefield would allow the United States to play a key role in shaping the peace settlement.

The United States had made few preparations for war during the period of neutrality. Available active-duty and reserve troops numbered fewer than 350,000, with only enough artillery and ammunition to support approximately 220,000 men. When the war ended on November 11, 1918, the Americans would look back over the past 19 months and marvel that they had managed to raise an army of more than 4 million men, transport 2 million to France, and command a field army of

1.2 million in major offensive operations along the Western Front. Despite these significant achievements, the Americans paid a price for their inexperience and unpreparedness. American-commanded operations in the last 4 months of the war (when the United States took over its own sector of the Western Front) were hampered by disorganization in the rear, high casualty rates, and constantly changing leadership—problems all symptomatic of an army forced by circumstances to fight before it was fully trained and formed.

American Strategy

The American Expeditionary Forces (AEF) commander, John J. Pershing, had perhaps greater latitude than any American commander before or since to direct overall military operations as he saw fit. In the summer of 1917, Pershing selected the Lorraine sector as the eventual site for an independent American presence along the Western Front. He also devised an overall strategic plan that settled on taking Metz, the site of critical railroads, as the key to defeating Germany. To fight in the open terrain of the Moselle Valley, Pershing developed an open warfare strategy that served his dual purposes of training his army to fight in this region while also creating a uniquely American combat doctrine that would clearly separate American fighting technique from that of the French or British. Open warfare became Pershing's mantra throughout the war, a concept defined as much by the failings he saw in the Allied approach to war as his eagerness to champion American initiative and individualism. Trench warfare, the AEF commander concluded, had weakened the aggressive spirit of the Allied forces, and now their troops fought ineffectively when forced out of the trenches and into the open battlefield. To further this goal of open warfare, Pershing decided to form divisions twice the size of their Allied counterparts and to privilege the firepower of the infantry over the artillery. As a result, American divisions went into combat with the same artillery as European divisions half their size and with a combat doctrine at odds with the military values embraced by the nation's major allies.

Pershing's steadfast commitment to creating an independent army caused much conflict with the

French and the British. Throughout the war, French general Philippe Pétain argued forcefully that it would be more efficient to funnel fresh American troops into existing Allied divisions. Pershing's reliance on his allies to train, transport, and equip his troops did force some compromises in how and where the Americans fought. Although Pershing repeatedly resisted Allied demands to amalgamate American troops permanently into their armies, American units did a significant amount of fighting under British and French command. Between March and July 1918, German forces under the command of General Eric Ludendorff launched a series of five major assaults against the British and French lines, and by May, the German army was within 40 miles of Paris.

Key Battles

Ultimately the assault collapsed due to poor logistical support on the German side, but the arrival of American troops on the battlefield at key moments also helped stem the German advance. In March, at the height of the German spring offensives, Pershing offered American troops to Marshal Ferdinand Foch, the newly appointed Supreme Commander of the Allied Armies on the Western Front. For the next 2 months, American troops occupied quiet sectors of the front to free up more experienced British and French soldiers before undertaking the first major American-commanded engagements of the war at Chateau-Thierry (May 27 to June 5, 1918), Cantigny (May 28–31, 1918), and Belleau Wood (June 6–25, 1918), which helped stem the German offensive. Over the summer, the Americans joined the Allied counteroffensives, which included successful fighting at Soissons (July 18–22, 1918), a battle that Pershing considered as the turning point that put the Germans on the defensive for the rest of the war.

In September 1918, the AEF successfully executed part of Pershing's initial strategic plan by straightening out the St. Mihiel salient (September 12–16, 1918). Pershing had expected this battle to put the Americans in a better position to launch their planned 1919 attack on Metz. Instead, it proved a costly diversion that left the Americans with only 2 weeks to get into position 60 miles away to begin the Meuse-Argonne offensive, the American component of the final coordinated Allied attack along the Western Front that would end in an eventual Allied

victory. Contrary to American expectations, their larger divisions often proved unwieldy and difficult to maneuver during this final 47-day battle that lasted from September 26 to November 11, 1918. The battle was the largest American military engagement to date, engaging 600,000 men, 4,000 artillery guns, and 90,000 horses on the opening day. Nearly 45,000 men were killed and wounded in the first 4 days of the battle, and more U.S. troops died in September and October, 1918. Some of these casualties were the result of poor command decisions and inadequate training. Huge traffic jams in the rear prevented supplies from reaching the front lines, further hampering the progress of the Americans. The fighting ability of the AEF improved as the battle wore on, however, and the final days saw the introduction of rear-area aerial bombing, better coordination between the infantry and artillery, and the use of infantry assault teams to knock out machine gun nests. By early November, the Allies had captured one fourth of the German army and half of its guns along the Western Front. With the newly introduced convoy system reducing the effectiveness of U-boats and millions more Americans on their way to the Western Front, Germany sued for an armistice. Overall, nearly 53,500 American men died in combat compared with 1.3 million Frenchmen and 900,000 British.

Historical Interpretations

In assessing the American experience of war, historians have focused on the path to war, the strategic decisions and mistakes made by military commanders, and the contribution of the United States to the eventual Allied victory. On America's decision to declare war, scholars have disagreed about which factors played the most decisive role in prompting Wilson to abandon neutrality for belligerency—financial ties with the Allies, concerns about German aggression, or his desire to shape the peace. Historian Ross Gregory, in *The Origins of American Intervention in the First World War* (1971), notes that disproportionate trading and lending to the Allies increasingly tied American economic prosperity to an Allied victory, while negative publicity surrounding the *Lusitania* and Zimmermann Telegram hardened American views against Germany. This emphasis on the trade benefits that war bestowed has fallen out of favor, although Benjamin O. Fordham

has recently argued for a reconsideration of economic causes to explain American entry into World War I. Wilson's biographer, John Milton Cooper Jr., in his *Woodrow Wilson: A Biography* (2009), emphasizes Wilson's activist personality. Facing the prospect of an indefinite period of armed neutrality and languishing interest in his "peace without victory" proposals, Wilson decided to support a war with Germany to achieve his larger goal of creating a new structure to govern international relations in the postwar world. Lloyd E. Ambrosius in his *Wilsonianism: Woodrow Wilson and His Legacy in American Foreign Relations* (2002) agrees that Wilson's desire to spread American-style democracy and capitalism were the catalyst that drew the United States into war but disagrees with Cooper on the legacy of this decision. Whereas Cooper observes the origins of fundamentally sound democratic values that would guide future foreign policy, Ambrosius laments the birth of a destructive messianic impulse that would justify countless American interventions throughout the world in the 20th century. Presidents after the Wilson era viewed World War II and the Cold War as a second chance to realize Wilson's vision of constructing a new world order. Drawing lessons from both Wilson's rhetoric and failures, American leaders as diverse as Harry Truman, Lyndon Johnson, and Richard Nixon continued to believe that America's national security depended on spreading democracy and active engagement in the world even as they sought alternative routes to realize Wilson's vision of collective security.

Scholars have also focused on how well the American Army performed during the war. Pershing took the lead in establishing one major interpretative school of thought with his two-volume autobiography, *My Experiences in the World War* (1931). This memoir championed Pershing's tenacity in overcoming Allied resistance to build an independent army that, after a few trials by fire, evolved into a first-rate fighting force that played a critical role in winning the war. Historians such as Harvey A. DeWeerd, *President Wilson Fights His War: World War I and the American Intervention* (1968), and Edward Coffman, *The War to End All Wars: The American Military Experience in World War I* (1968) added some qualifications to this tale of glowing success, but it wasn't until the 1970s and 1980s that revisionist scholars began to fully attack the Pershing narrative. James

W. Rainey, Timothy K. Nenninger, Donald Smythe, and Paul Braim instead portrayed the AEF as a poorly trained, led, supplied, and deployed force whose slow improvements over time did not excuse the initial mistakes made by AEF commanders. Many scholars took issue with Pershing's insistence on undertaking the preplanned attack on St. Mihiel after Foch made it clear that the Americans would need to take part in a coordinated Allied attack 2 weeks later. Arriving at the Meuse-Argonne with his best troops tired and their logistical network in disarray, the Americans entered this major battle at a disadvantage. Mark E. Grotelueschen, *The AEF Way of War: The American Army and Combat in World War I* (2006), and Edward G. Lengel, *To Conquer Hell: The Meuse-Argonne, 1918* (2008), have tried to change the tenor of this debate by moving the spotlight away from top-level leadership and instead focusing on the learning curve under way within divisions and companies among the officers and men directly involved in the fighting. Rather than painting the British and French as corrupting forces within the AEF, these two have emphasized how commanders and men adapted their methods of fighting based on actual combat experiences and interaction with Allied instructors and liaisons. They find successes as noteworthy as failures, striking a middle ground between the Pershing narrative and revisionist accounts. In their view, the most substantial and effective learning occurred bottom-up. Other historians have taken issue with the tendency to judge American success by how well Pershing realized his goal of creating an independent army. David Trask, *The AEF and Coalition Warmaking, 1917–1918* (1993); Robert Bruce, *A Fraternity of Arms: America and France in the Great War* (2003); and Mitchell Yockelson, *Borrowed Soldiers: Americans Under British Command, 1918* (2008), have instead emphasized the importance of American participation in coalition fighting, seeing this as the real lesson to be learned from the war.

More disagreement surfaces when evaluating the ultimate role that the United States played in winning the war. John Mosier, *The Myth of the Great War: A New Military History of World War I* (2001), carries Pershing's claim that the Americans were responsible for the Allies' decisive win into the present day. On the other side of the pendulum, World War I historians Gary Sheffield, Robin Prior, Trevor Wilson, Tim Travers, and Ian Beckett view

the American military contribution as negligible, citing instead British and French improvements in war making, especially the coordination between infantry and artillery that allowed a breakthrough in the

trench deadlock to occur in 1918. In these accounts, the long learning curve reached fruition when the Allies learned how to harness the power of their own artillery. Most American scholars of the AEF

are more circumspect about the overall difference the AEF made to the ultimate victory. Most contend that the Americans may not have won the war for the Allies, but they certainly kept them from losing it. They emphasize the infusion of American troops that helped stem the German spring offensives and fueled the overall Allied advance, German demoralization when faced with the prospect of millions more Americans arriving in the coming year, the effectiveness of the American convoy system, and the importance of ongoing American financial support as critical contributions that the United States and its armed forces made to the Allied victory.

WORLD WAR II

What historians and the public refer to as World War II was the joining, between 1937 and 1941, of two separate but related conflicts: the Second Sino-Japanese War, which began in July 1937, and the Second World War in Europe, which began with the German invasion of Poland in September 1939. The European war ended with Germany's unconditional surrender in May 1945, and Japan's surrender in August 1945 ended the war in Asia and the Pacific. The Second World War claimed between 50 and 70 million lives. Of this total, the United States suffered 322,000 dead.

World War II featured two alliances, the Axis and the Allies. The primary Axis nations included Germany, Italy, and Japan, while the major Allied powers included Great Britain, the Soviet Union, China, and the United States. However formidable, the Axis was a far weaker coalition, and in 1939, its combined population was scarcely greater than the Soviet Union's, while U.S. industrial production equaled the combined Axis output as early as 1942.

The War in Europe, September 1939 to December 1941

The origins of the war in Europe are clear and explicit, and the responsibility rests with Adolf Hitler and Nazi Germany. Shortly after assuming complete control of the German government in 1934, following the Nazi Party's solid gains in the elections, Hitler's appointment as German chancellor in 1933, and President Paul von Hindenburg's death in 1934, Hitler began to systematically violate the Versailles Treaty, the 1919 agreement that ended World War I. After Germany absorbed Czechoslovakia in March 1939, England and France abandoned their policy of appeasement, whereby Germany had been allowed to unilaterally abrogate existing treaty agreements, and publicly pledged to defend Poland and other nations from German aggression. The August 1939 Nazi-Soviet nonaggression agreement freed Hitler from the prospect of a two-front war and facilitated the September 1, 1939, invasion of Poland. Within days of the attack, Britain and France promptly honored their commitment and declared war on Germany.

Despite Anglo-French support, Poland fell within a month. In Poland, and again in early 1940 against Denmark and Norway, the German military displayed its new Blitzkrieg strategy (lightening war), which combined land and air assaults and the employment of airborne and armor for maximum effect. The Germans applied this new doctrine again in the spring of 1940 when they bested the Belgian, Dutch, and French armies in just 6 weeks. While slightly outnumbered in infantry, artillery, and armor, superior German tactics and control of the air, combined with Allied mistakes and low morale, doomed France. Only the May 26 to June 4 "Miracle at Dunkirk," in which the British evacuated the bulk of their army, some 340,000 soldiers, ahead of the advancing Germans, lessened the enormity of the Anglo-French defeat.

Although successful on the Continent, the German war machine faltered when the Luftwaffe (German air force) attempted to gain air supremacy over southern England in preparation for a cross-channel invasion. Germany's defeat in the August to October 1940 Battle of Britain prevented a seaborne invasion of the British Isles, and American aid during the winter and spring of 1940–1941 helped sustain British resistance. Washington's transfer of 50 World War I-era destroyers proved vital to Britain's antisubmarine campaign, and the massive Lend Lease program, under which Washington eventually directed \$50 billion in aid to Allied nations, ensured England's survival. Unable to defeat Britain or starve it into submission, Hitler turned his attentions elsewhere.

In June 1941, Germany launched Operation Barbarossa, a massive three-pronged assault against the Soviet Union, involving some 4 million men along a nearly 1,500-mile-long front. Stunned, the Soviets experienced staggering losses, both in terms of manpower and territory. By December, the Red Army had nearly three quarters of a million dead and, partly because of Joseph Stalin's order forbidding retreat, some 3 million men captured. By this time, German forces occupied the Baltic states of Latvia, Lithuania, and Estonia, as well as present-day Belarus and the bulk of the Ukraine and had advanced to the gates of Moscow. On December 5, 1941, however, the Soviets launched a successful counterattack, thus sparing their capital and avoiding defeat. Two days later, the USSR won another great victory when the United States entered World War II.

Asia and the Pacific, July 1937 to December 1941

While the causes of the war in Europe are clear, the origins of the Second World War in Asia and the Pacific are more difficult to trace. That being said, the conflict resulted in large measure from the American response to the Sino-Japanese War, which began in July 1937 following a clash between Japanese and Chinese forces at the Marco Polo Bridge on the outskirts of Peking, as well as the course of the fighting in Europe.

The Sino-Japanese War immediately alarmed the Western democracies and exacerbated Japan's relations with the United States. Beginning in 1938, Washington built up its naval forces, instituted

economic restrictions against Japan, and increased aid to the beleaguered Chinese. Japan responded to America's naval buildup, economic sanctions, and aid to China, as well as continued Chinese resistance and Germany's early overwhelming victories in Europe, by joining the Axis Alliance in September 1940. Rather than deter the United States, as Japanese diplomats had hoped, this action only worsened Japanese-American relations. The United States, for example, increased both sanctions and rearmament after September 1940, especially once it became clear that England would prevail in the Battle of Britain. Washington also pursued diplomacy during the winter and spring of 1941, when England's future appeared in doubt, and again in the autumn of 1941, when it looked like the German blitzkrieg would bring down the USSR. Neither American sanctions, which culminated in a general Anglo-American-Dutch embargo in the summer of 1941, nor American-Japanese diplomacy, which featured a proposed leaders' summit and multiple plans to avoid war, could keep the peace in the Pacific. Denied access to Western oil, Japan struck the United States at Pearl Harbor on December 7, 1941, and launched near-simultaneous strikes against British and Dutch targets. With Washington's swift declaration of war the next day, and Germany's immediate decision to enter the war on the side of Japan, the wars in Europe and Asia were joined.

Europe, 1942–1945

With America's entry into the war and Russia's continued survival, the prospects for a German victory dimmed. On the Eastern Front, the Red Army tied down the bulk of the German military for the remainder of the war. In the spring of 1942, the *Heer* (German army) continued its advance deeper into the Soviet Union, but unlike 1941, the Germans could only advance along one front. As in the previous summer, the Red Army initially proved no match for the Germans, whose Army Group South steadily advanced toward the Volga River and farther south toward the Caucasus oil fields. After the Germans entered Stalingrad in November 1942, Soviet forces fought tenaciously to hold the city. In a few weeks, the Red Army managed to encircle the city, trapping the 300,000 German troops in and around the city. Unable to break out, the survivors, numbering less than 100,000, surrendered in February 1943.

The following spring, the Germans once again took the offensive until the Soviets decisively defeated them at Kursk, in eastern Ukraine, in a battle in which more than 2.5 million men and 7,000 tanks took part. After the Battle of Kursk in July and August 1943, the initiative passed to the Soviets who for the next 2 years pushed the retreating Germans all the way to Berlin.

As the Red Army struggled to stem the German invasion, the United States and Great Britain fought an equally formidable, though less deadly, German enemy: the U-boat. From the war's outset in September 1939, German raiders, surface ships, aircraft, and mines all took a heavy toll on Allied merchant ships, but even combined, they caused far less damage than German submarines. As the number of U-boats grew from 57 in September 1939 to 300 in July 1942, Allied losses mounted. With the U.S. entry into the war, German submarines, now free to carry their attacks to American shores, celebrated the "Happy Time," a period when they took advantage of American inability to protect coastal shipping in order to inflict devastating losses. By the summer of 1942, German submarines were able to sink 7 million tons of Allied shipping (an average merchant ship displaced 5,000 tons) in the Atlantic war zone. By the following summer, however, the Allies had averted disaster and won the "Battle of the Atlantic."

First, the Allies minimized losses by using radio intelligence to locate concentrations of German submarines and reroute merchant ship convoys away from the danger. Next, American naval expansion provided some 200 additional escort ships as well as new escort carriers, which carried 20 aircraft each and provided an "air umbrella" for the threatened convoys. By this time, the deployment of the VLR (very long range) B-24 Liberator to bases in Canada, Iceland, and the British Isles allowed for near-continuous air patrols over the convoy routes. Escort ships and air power saved Allied ships from destruction while increasing the danger to German submariners. By the spring of 1943, German submarines were forced to travel more time submerged, which slowed their travel and expended precious fuel, or face destruction from above. In May 1943 alone, Germany lost 43 submarines, a number that forced Berlin to recall its vulnerable U-boat fleet from the high seas and led the fleet's commander, Admiral Karl Doenitz, to conclude, "We had lost the Battle of the Atlantic."

In addition to defeats in Russia and on the high seas, Germany also faced an increasingly withering Anglo-American bombing campaign. While fortunes were reversed early in the war, particularly during the Battle of Britain, and again during the war's final month when German V1 and V2 rockets rained down on London, by mid-1942, the Anglo-American bombing offensive was under way. The American 8th Air Force, the first U.S. bombers to carry the war to Germany, began its mission in August 1942. American bombers flew predominately daytime raids and practiced precision bombing. In contrast, the more lightly armed Royal Air Force bombers more often bombed at night and commonly practiced area bombing, whereby a general area, rather than a specific target, was attacked.

In the spring of 1943, the joint Anglo-American Combined Chiefs of Staff (see below) agreed to Operation Pointblank, a combined British-American bombing campaign designed to strike German air, sea, and ground forces and their supporting infrastructure (i.e., ball bearing plants, oil refineries, tank farms, submarine pens, etc.) in order to weaken the military, break the will of the German people, and pave the way for the invasion of German-occupied Western Europe. The 8th Air Force temporarily suspended daylight bombings after Black Week, the series of October 1943 raids against multiple targets—including the heavily defended ball bearing factories in Schweinfurt—which resulted in the loss of one in four of the attacking B-17 bombers. Operations resumed the following February, however, with the addition of long-range escort fighters. The bombing campaign reached its height in 1944, when the combined Anglo-American bomber fleets, augmented by the U.S. 15th Air force, based in Italy, dropped slightly less than 1 million tons of ordnance on German targets.

All told, the bombing of Germany killed nearly 600,000 German civilians and cost the lives of slightly fewer than 160,000 Allied airmen. Efforts to break German morale, however, failed, despite instances of terror bombing, including the July 1943 raids on Hamburg that resulted in 45,000 civilian deaths. Strategic bombing, meanwhile, did not cripple German industry but did cut aircraft and tank production by better than a third and drastically affected German oil output and transportation. Perhaps most important from the standpoint of Pointblank's original goals was that by D-Day, the

Coast Guardsmen on the deck of the U.S. Coast Guard Cutter *Spencer* watch the explosion of a depth charge that blasted a Nazi U-boat's hope of breaking into the center of a large convoy. The depth charge tossed from the 327-foot cutter blew the submarine to the surface, where it was engaged by Coast Guardsmen. Ships of the convoy may be seen in the background. The Nazi U-175 was actually targeting the tanker *SS G. Harrison Smith*. The Germans had already entered the targeting information on their torpedo data computer when the *Spencer* first attacked. *Spencer's* timely and effective attack thereby saved the tanker and her crew.

bombing campaign had destroyed the Luftwaffe as an effective fighting force as the Germans lost some 15,000 aircraft in a vain effort to save their cities from destruction.

As the Red Army blunted and then threw back the German invasion and Anglo-American naval and air forces turned the tide of battle in their respective theaters, Britain and America prepared to open a second front in German-occupied France. Soon after entering World War II, the U.S. military developed a plan, Operation Sledgehammer, for a cross-channel invasion. British resistance and a lack of landing craft led officials to scrap the plan in favor of Operation Torch, the November 1942 invasion of French North Africa. Torch allowed the Allies to advance on the Italians and the vaunted German Africa Corps led by Erwin Rommel, from two directions. With the British advancing from Egypt and the Americans, having recovered from an early setback in the February 1943 Battle of the Kasserine Pass, advancing from Tunisia, the Allies drove the Axis from North Africa in May 1943.

The Allies next struck Italy, first with assaults on the island of Sicily in July 1943, before moving on to the Italian mainland in September 1943. The September landing produced a quick Italian surrender but no peace, as the German forces soon occupied the bulk of the peninsula. For the remainder of the war, Italy proved a deadly theater where German forces, and those Italians that remained loyal to the Italian dictator Benito Mussolini, fought Allied forces and anti-Fascist Italians until the war's final hours in May 1945.

While the fighting at sea, in the air, and in peripheral theaters such as North Africa and Italy was important, the war was won on two decisive fronts: first in the East and then, after considerable delay, in the West. The long awaited Allied landings in France at last materialized on June 6, 1944, when a little more than 150,000 Allied troops landed or air-dropped on or near five French beaches along the Normandy Coast. After weeks of buildup and fighting in the coastal hedgerow country, American forces broke through German defenses on July 25. Paris fell to advancing Allied armies on August 25,

but German forces shattered hopes for an early peace with an unexpected and successful December counteroffensive against Allied forces in northern France, Luxembourg, and Belgium. During the nearly 6-week-long Battle of the Bulge, U.S. casualties numbered almost 90,000, while German losses, by some estimates, reached as high as 100,000.

During the war's final months, Allied armies advanced on Germany from two directions. In the west, Allied forces poured into Germany in late February and March with American forces halting along the Elbe River, approximately 150 kilometers from Berlin. The Soviets, meanwhile, began Operation Bagration, a massive counteroffensive against the overstretched Germans, just 2 weeks after the Normandy landings, which propelled the Red Army into Eastern Europe. The battle for Berlin resulted in 300,000 Red Army casualties; Berlin fell to the Soviets on May 2, and 5 days later, German forces unconditionally surrendered to the Allies, marking the end of the war in Europe.

Asia and the Pacific, 1942–1945

While German conquests had reached flood tide by the time the United States entered the war in

Europe, the opposite was true in Asia and the Pacific where, for the first 6 months of the war, Japanese forces were all but unstoppable. Between December 1941 and May 1942, Tokyo conquered the crucial British colonies of Malaya, Singapore, and Burma, the Dutch East Indies, and America's colony, the Philippines. Japanese forces also penetrated deep into the Pacific, overrunning the American outposts in Guam and Wake Island and British possessions in the Gilbert and Solomon Island chains.

Although the United States achieved a major psychological victory with the April 1942 Doolittle raid, in which 16 carrier-borne bombers struck Tokyo and four other cities and blunted Japan's advance toward Australia in the May 1942 Battle of the Coral Sea, Tokyo's first major defeat came in June 1942, at the Battle of Midway. There, Japan lost four aircraft carriers; after Midway, the naval balance of power in the Pacific swung decidedly to the United States, where it remained for the war's duration.

Following its victory at Midway, the United States led an island-hopping campaign across the Pacific. Beginning at Guadalcanal from August 1942 to February 1943, the United States and its allies attacked select islands as part of a strategy that

sought first to establish airbases with which to interdict supplies and bomb targets in the home islands, before seizing bases nearer Japan, which could be used in the event of an invasion. During the summer of 1944, American forces seized key islands in the northern Marianas that allowed the United States to begin a sustained bombing campaign against targets throughout Japan.

From February to August 1945, B-29 bombers of the American 21st Bomber Command operating out of the newly won bases in the Marianas struck nearly every major Japanese city. Flying at night and using incendiary bombs, U.S. forces had, by the start of summer of 1945, killed some 260,000 people while leaving an additional 10 plus million homeless. During this same period, American forces carried island hopping closer to Japan. In February, U.S. Marines landed on Iwo Jima where more than 6,000 Americans and 21,000 Japanese died before the island fell the following month. From April to June 1945, an overwhelmingly American-led force seized the Japanese island of Okinawa in preparation for an invasion of the home islands. At Okinawa, the Japanese used almost 2,000 kamikaze attacks, where pilots deliberately crashed their explosive laden aircraft into the predominately U.S. flotilla. All told, nearly 7,000 Americans and 110,000 Japanese lost their lives at Okinawa.

In addition to its setbacks throughout the Pacific, Japan also found itself on the defensive in Southeast Asia. After blunting the Japanese invasion of India in the spring of 1944, a largely British-led counterattack retook most of Burma by war's end. Elsewhere, American forces retook the Philippines during the autumn and winter of 1944 and destroyed some 300 aircraft and more than 60 warships during the October 23–26 Battle of Leyte Gulf. Only in China could the Japanese forces still take the initiative, and during Operation Ichi-Go, mounted from April to December 1944, Japanese forces won repeated victories over Chinese Nationalist forces in central and southern China.

Despite losses in the Pacific and Southeast Asia and the American-led bombing campaign, Japan refused to surrender. The long-awaited invasion, however, which was slated to begin in November with an invasion of Kyushu at a projected cost of 268,000 American casualties, never occurred. Instead, Japan capitulated on August 15, following the August 6 atomic bombing of Hiroshima,

the Soviet Union's declaration of war on August 8, the August 9 atomic attack on Nagasaki, and the American decision on August 11 to allow Japan to retain Emperor Hirohito. The war in Asia and the Pacific formally ended with the signing of the instrument of surrender on board the USS *Missouri* on September 2, 1945.

Wartime Diplomacy and Military Cooperation

Part of the Allies military success can be explained in reference to the extraordinary degree of Anglo-American political and military cooperation and the ability of the “Big Three” powers—the United States, Great Britain, and the Soviet Union—to work in relative harmony despite their often divergent war aims. In contrast, the Axis powers never achieved this level of cooperation and coordination. Hitler and Japan's wartime Prime Minister Hideki Tojo, for example, never met nor did the two sides share their plans or intentions. Berlin never informed Tokyo of its intention to either conclude a nonaggression agreement with Moscow in August 1939 or its plan to break the agreement and attack the USSR in June 1941. For their part, Japanese leaders neither informed German officials of the impending April 1941 neutrality agreement with Moscow nor of their plan to go to war with the United States, Great Britain, and the Dutch Empire in December 1941. Nazi Germany and Fascist Italy cooperated to a greater degree, and Hitler and Mussolini met 17 times between 1934 and 1944. Despite their frequent meetings, however, the two leaders never achieved the level of cooperation enjoyed by the U.S. president Franklin D. Roosevelt and the British prime minister Winston Churchill.

Axis efforts to coordinate their vast military machines likewise failed, despite the 1942 agreement to divide the globe into three operational zones. Senior German commanders, for example, discouraged their subordinates from liaising with their Japanese counterparts, divulging war plans, or securing direct Japanese military participation in German operations. Italian-German military cooperation fared little better and focused more often than not on each nation's military priorities rather than joint planning for common objectives. Early in the war, this lack of cohesion was most apparent in France, where Italy declared war only on June 10, a

month after the campaign had begun, and in Greece, where Germany intervened in April 1941, 6 months after Mussolini's invasion had begun. Later in the war, Italian-German cooperation splintered as each nation vied for influence in occupied territories such as Croatia, and by the time the Allies landed in Sicily in July 1943, control had replaced cooperation as the Italian defenders had ceded to their German partners the defense of their home soil. Set against this dismal record of cooperation, the Allies managed to maintain unity despite their divergent goals and dissimilar political and economic institutions.

Throughout the war, the core of the alliance remained the "special relationship" forged by the United States and the United Kingdom. In fact, Anglo-American cooperation began long before the first bombs fell on Pearl Harbor. In June 1941, secret talks, dubbed ABC 1, began in Washington, D.C., between senior American, British, and Canadian military officials. By the time the talks concluded in March, the conferees had agreed to focus their shared resources on the defeat of Germany while waging a defensive struggle against Japan in Asia and the Pacific.

Military cooperation was soon matched by collaboration among senior American and British civilian officials. In August 1941, President Roosevelt and Prime Minister Churchill met for the first time. During the secret talks, held off the coast of Newfoundland, Canada, the two leaders, accompanied by senior military and civilian advisors, refined earlier military planning and produced the Atlantic Charter, an extraordinary document that delineated the common Anglo-American war aims and vision for the postwar world. Included in the document was a common pledge to forgo territorial aggrandizement while seeking free access to raw materials, political self-determination, and the peaceful resolution of disputes.

With America's entry into the war 4 months later, Anglo-American military and political cooperation increased. Just 2 weeks after Pearl Harbor, Prime Minister Churchill arrived in Washington for the nearly 3-week-long Arcadia Conference. Arcadia reaffirmed the Germany-first strategy, produced the Declaration of the United Nations (essentially a restatement of the Atlantic Charter), and created a common British and American Combined Chiefs of Staff. The creation of the Combined Chiefs of Staff, which underscored the need for greater cooperation

within the U.S. military, quickly led to the creation of the U.S. Joint Chiefs of Staff a month later.

In June 1942, Churchill arrived in Washington yet again and U.S. and British officials agreed to forgo an immediate cross-channel invasion in favor of landings in French North Africa. Two months after the successful Torch landings, Churchill and Roosevelt held their fourth meeting, this time in Casablanca, French Morocco. At Casablanca, the two leaders announced the unconditional surrender policy for the defeated Axis and worked to ameliorate differences between Charles de Gaulle and Henry Giraud, competing leaders for the Free-French movement. At Casablanca, the Combined Chiefs met regularly and formulated plans to invade Italy before the year's end.

The war in Asia and the Pacific dominated the next major conference, held in Cairo, Egypt, in November 1943. Cairo furthered wartime cooperation by including the Chinese leader Generalissimo Chiang Kai-shek and produced an agreement to strip Japan of its entire overseas empire, including gains dating back to the 1894–1895 Sino-Japanese war. From Cairo, Churchill and Roosevelt flew to Tehran, Iran, for the first of the "Big Three" summits with the Soviet leader Joseph Stalin. At Tehran, Roosevelt labored successfully to establish a working relationship with Stalin, who promised to launch a major offensive on the Eastern Front to coincide with the Normandy landings.

The next "Big Three" summit, held in Yalta on the USSR's Crimean Peninsula in February 1945, was far more significant and far more contentious than Tehran. At Yalta, Roosevelt gained Stalin's commitment to join the United Nations as well as vague Soviet guarantees to hold free and fair elections in Poland. The three agreed on German reparations and to include France in Germany's postwar occupation. Anxious to secure Russian participation in the coming invasion of Japan, Roosevelt also secured Stalin's pledge to enter the war in Asia and the Pacific 90 days after Germany's surrender.

The last major wartime conference, held at Potsdam in defeated and occupied Germany during July 1945, featured two new figures. President Roosevelt had died the preceding April and so Harry S. Truman attended his first, and last, World War II summit. A second new face at Potsdam was Clement Attlee, who replaced Churchill midway through the conference after his Labor Party swept to victory in

the British national elections. Despite new personalities, the conferees agreed on German occupation zones, Poland's new western border, and limitations on Russian reparation from occupied Germany.

Despite its focus on Germany, the conference is best known for the July 26 Potsdam Declaration. Issued just 10 days after the successful atomic bomb test at Alamogordo, New Mexico, the declaration called for Japan's unconditional surrender, despite urging from the then undersecretary of state and former ambassador to Japan, Joseph Grew, that the Allies guarantee the continuation of Japan's imperial system. Although some of the scientists who created the bomb urged a test demonstration rather than an attack on Japan, Tokyo's swift rejection of the declaration led to the twin atomic attacks on Hiroshima and Nagasaki.

Industry, Science, and Manpower

In addition to the remarkable achievements secured by the Allied soldiers and statesmen, victory over the Axis also rested, in part, on the unmatched industrial and scientific output of the United States, Great Britain, and the Soviet Union, as well as the manpower of these nations and China. American industry, one key to the Allied victory, outproduced the entire Axis by the end of 1942. Between the fall of France and VJ Day, 62 months later, the United States produced nearly 300,000 aircraft, more than 75,000 ships, and some 87,000 tanks. British scientists, meanwhile, pioneered the development of radar and jet engine technology and played a critical role in the success of the American-led Manhattan Project, which developed the atomic bomb. Although Soviet technology lagged behind that of America and Britain, the USSR made significant improvements in aircraft design and also produced remarkably reliable and resilient weapons such as the T-34 tank. Although the T-34 and the vastly inferior U.S. Sherman tank were outmatched by the main German battle tanks, the Panzers III and IV, U.S. and Soviet industry outproduced the Germans by a ratio of more than 5:1. German inability to match Soviet-American tank production was also indicative of another, deeper problem. The nation with the finest armor, first operational jet aircraft (the Messerschmitt 262), and long-range surface-to-surface missiles (the V1 and V2 rockets) could not produce an adequate long-range bomber or even

sufficient mechanized transport. Two years into the war, at the start of Barbarossa, German horses outnumbered German mechanized transport.

Just as Allied war production overwhelmed the Axis, so too did Allied manpower. Though its population was dwarfed by the other combatants, Great Britain summoned the Commonwealth and the near limitless manpower reserves of its empire, most notably India, whose army numbered nearly 2.5 million by the war's end. Nationalist China, meanwhile, maintained an army of some 5 million, only half a million men fewer than the Japanese army, while the United States built a military of nearly 16 million men and women. The Soviet Union, despite wartime losses of some 26 million, conscripted nearly 30 million soldiers, 10 million more than Germany during the period from 1934 to 1945.

Continuing Controversies

The passage of time has not erased the many historical controversies created by World War II. First and foremost for some Americans is the controversy surrounding the Japanese attack on Pearl Harbor. Beginning with books such as Charles Tansill's *Back Door to War: The Roosevelt Foreign Policy, 1933–1941* (1952) and later Robert B. Stinnett's *Day of Deceit: The Truth About FDR and Pearl Harbor* (2000), historians and journalists have painted a beguiling web connecting the White House to the wrecked and burning fleet at Pearl Harbor. While refuted by the bulk of historical evidence, as well as the nine separate civilian and military inquiries held between December 1941 and May 1946, speculation still persists that the president and his key military advisors were aware of the planned Japanese attack on Pearl Harbor but did not take action.

A deeply ingrained controversy likewise surrounds the war's end in August 1945. For more than half a century, historians have debated key issues surrounding the use of atomic weapons, including whether or not the bombs were necessary to secure Japan's surrender, as well as other motives for the atomic attacks. While leading civilian and military figures argued in 1945 that the twin attacks ended the war and saved countless American and Japanese lives, critics of the decision—including the activist Norman Cousins and Patrick Blackett, a Nobel Prize winning physicist—quickly challenged the orthodox interpretation. Historian and State Department

official Herbert Feis was among the first insiders to cogently and compellingly question the utility of the atomic bombs with the 1961 publication of *Japan Subdued: The Atomic Bomb and the End of the War in the Pacific*. Feis concluded that while the administration used the bombs to end the war quickly and unconditionally, it could have obtained Japan's surrender through other means. Gar Alperovitz likewise argued in his landmark revisionist study *Atomic Diplomacy: Hiroshima and Potsdam* that not only were the atomic attacks unnecessary, but they were also motivated far more by a desire to influence the postwar Soviet Union than by a desire to secure Japan's immediate, unconditional surrender. However compelling, the revisionist school has faced repeated challenges, especially in the past two decades by the resurgence of the orthodox

interpretation in well-received works such as the historian Robert H. Ferrell's *Harry S Truman: A Life* and author Stanley Weintraub's *The Last Great Victory: The End of World War II July/August 1945*.

The war's major historical controversies and debates are not limited to those surrounding the conflict's origins or end, and many of the most enduring questions involve major campaigns and individual battles and the armies and men who fought them. For a generation after VE Day (Victory in Europe Day), a host of historians and writers maintained that the German army was superior to the Allied forces and that quantitative rather than qualitative Allied advantages determined the war's outcome. The military historian S. L. A. Marshall's 1947 *Men Against Fire* cast serious doubt on the combat effectiveness of the U.S. Army after Marshall

Two women walking the streets of the destroyed city of Hiroshima, November 1945.

argued that in any given engagement, three quarters of the general infantry involved failed to fire their weapons. The Dutch-born Israeli historian Martin Van Creveld furthered the idea of German military superiority in his 1982 *Fighting Power: German and U.S. Army Performance, 1939–1945*, when he maintained that German “small unit cohesion, training, and tactics, made their combat units much more effective” than their American counterparts.

However, within a decade of *Fighting Power*’s publication, revisionist scholars cogently challenged the dominant orthodox interpretation, and with the publication of Richard Overy’s *Why the Allies Won* (1995), the pendulum swung decisively away from the Marshall-Creveld school. Overy compellingly demonstrated that whatever its early deficiencies, by 1944 the U.S. Army stood on a par with its German counterpart. Soon after Overy’s publication, revisionist scholars, John Whiteclay Chambers II foremost among them, highlighted shortcomings in Marshall’s methodology that called into question the foundations of the orthodox argument.

The war in Europe continues to generate other significant controversies, foremost among them the Allied landings in occupied France and the long-awaited second front. The Soviet Union had pressed for an early Western landing in German-occupied France, but the British opposed Sledgehammer and pushed successfully for landing in North Africa and Italy. While the Mediterranean campaign bled resources from an assault on northern France, the disastrous August 1942 Anglo-Canadian raid on the French port of Dieppe, where over half of the largely Canadian landing force was lost, validated British caution.

Although the Allied landings at Normandy in June 1944 are rightly hailed as a success, controversy nonetheless surrounds the war’s final year in Europe, especially the wide-front versus narrow-front controversy. Confident that a broad advance was safer, General Eisenhower favored a wide-front strategy, in which ground forces advanced into Germany along a northern and southern axis. British general Bernard Montgomery supported a narrow-front strategy that called for a single-line of advance into Germany, certain that this strategy would shorten the war and allow for the quick capture of Berlin. The failure of Operation Market Garden, Montgomery’s plan to seize bridges on the

Maas and Rhine rivers in September 1944, validated Eisenhower’s caution but has not ended the narrow-versus wide-front debate.

In the Pacific, historians and writers continue to debate the joint chiefs’ decision to approve an army-navy advance across the Pacific, with MacArthur and the army moving north from Australia and Nimitz and the navy moving on Tokyo from Hawaii. While intended to support one another, the strategy could also, argues historian Ronald H. Spector, “be mutually competing.” This competition could, in part, explain the decision to retake the Philippines, rather than striking farther north at Formosa, as had originally been agreed on by the joint chiefs in 1943. The reconquest of the Philippines during the war’s final 10 months cost 14,000 U.S. lives and hundreds of thousands of Philippine casualties, including the 100,000 who died in Manila’s recapture. The invasion of Iwo Jima in February 1945, made necessary because of the decision to forgo landings in Formosa, likewise ignited controversy both at the time and subsequently. Taken largely to facilitate the bombing campaign against Japan and provide an emergency landing site for long-range bombers making the journey from the northern Mariana islands, the invasion of Iwo Jima cost many more lives than it saved.

Lingering World War II controversies are not limited to the battlefield, and indeed, the final meeting between Roosevelt, Churchill, and Stalin at the Yalta Conference generates continued scrutiny and controversy. During the Cold War, the late president’s opponents charged that Roosevelt had sold out China, Poland, and the remainder of Eastern Europe to the Soviet Union. As historian Fraser J. Harbutt compellingly demonstrated in his 2010 *Yalta: Europe and America at the Crossroads*, “the Republican Party began to use Yalta systematically as a bludgeon against the Truman administration and Democratic foreign policy.” As late as 1985, right-wing critics of New Deal foreign policy continued to batter the Yalta agreements, with the conservative columnist Irving Kristol calling the summit one of America’s three greatest foreign policy mistakes.

Often forgotten in the polemics, however, is the fact that by February 1945, the Red Army already controlled much of Central and Eastern Europe, and so the president could do little but salvage what he could from the maelstrom created by the war’s end. Moreover, as continued Japanese resistance

promised to make the long-expected invasion of the home islands the most costly campaign of the entire war, Stalin's promise to engage Japan meant lower American casualties, and for this, Roosevelt had only to offer either what the Red Army already possessed or what it could easily have for the taking. In his often critical *Decisions at Yalta*, historian Russell D. Buhite highlights what all too many have forgotten when examining this long-ago conference. Yalta, Buhite notes, "was a conference in which the West had only a marginal chance of success." Even with the end of the Cold War, Yalta remains one of many enduring controversies that continue to intrigue both students and scholars of the Second World War.

WOUNDS AND INJURIES

Hippocrates, often hailed as the father of modern medicine, focused much of his writing on surgical techniques and wound care. Galen's work on the circulatory system and human anatomy ruled well into the Renaissance. As human knowledge advanced, so, too, did combat techniques and weaponry. With every major American war, the medical community gained valuable information on wound care and combat surgery. Since 1991, nontraditional weapons from nonstate actors have significantly changed the medical outcomes for soldiers because of the amount of damage they are capable of doing. However, as urban warfare continues with ever-evolving weaponry, the medical community is continuously researching new, more effective treatment protocols.

A Brief History of War Wounds

The first major war wound breakthrough was debridement, a procedure first used during the Russo-Turkish War. Medically, the debridement procedure had a doctor cut the infected, dying (necrotic) tissue until healthy tissue is found. This helped avoid amputation and gangrene when done shortly after the injury occurred. During the Revolutionary War, soldiers were treated in private homes and churches. In 1775, the Continental Congress established the Hospital Department for the Army, which

marked the mainstreaming of medical treatment of war wounds. The War of 1812 saw an increase in amputations performed shortly after the wound was inflicted, in hopes of shortening hospital stays, infection, and progressive healing. However, it was the Civil War that saw the height of amputations. Amputation was frequently used by both Union and Confederate forces. Although not the first choice for flesh wounds, many soldiers underwent amputation due to the nature of the injury and the dangers of secondary infection. Virginia's Stonewall Jackson suffered severe wounds requiring the amputation of his left arm after the Battle of Chancellorsville. Although he survived the surgery, he died from pneumonia shortly after.

In the time between the Civil War and the First World War, there were several major medical advancements. Debridement procedures evolved to include the removal of necrotic tissue and the application of silver nitrates, usually in a foil, to help fight and prevent infection. Although used sporadically during the Civil War, rapid evacuation steadily improved and was vital in the lower death rate during World War I. The war saw an increase of topical antimicrobial creams and lotions, lowering the infection rate after a wound. It was not until the onset of the Second World War that the introduction and widespread use of antibiotics, including sulfonamides and penicillin, were seen. Sulfa drugs, also called sulfonamides, became the first line of treatment for many skin wounds. Applied topically, soldiers carried packets of the powder with them to treat wounds of their peers on the front lines. Penicillin was effective in fighting staphylococci and streptococci bacteria, which were often present in wounds. Additionally, rapid evacuation and treatment by trained medical professionals helped keep more soldiers alive.

With the introduction of the helicopter, injured soldiers during the Korean War were airlifted to Mobile Army Surgical Hospitals (MASH), where they received lifesaving treatment. Many soldiers underwent cutting-edge vascular and arterial surgeries instead of amputation. During the Vietnam War, the proximity of hospitals and use of helicopters for evacuation meant faster access to well-trained and -equipped surgeons spread throughout South Vietnam. Incidence rates of infection after injury were in the single digits, unlike any prior war. Lifesaving technology, including mechanical

ventilation, was also used for the first time in a military setting.

Recent Developments

America's most recent wars, beginning with the Persian Gulf War in 1991, saw new forms of combat wounds and injuries. Shrapnel and bullet wounds evolved with each war; however, the use of improvised explosive devices (IEDs) gave enemy combatants new means of attacking soldiers. In the Persian Gulf War, IEDs played a notable role in the number of amputations, traumatic brain injuries, and concussions. This trend continued during the War in Afghanistan and the War in Iraq.

In both Afghanistan and Iraq, soldiers have suffered severe wounds causing brain injury and amputation, while the military has simultaneously procured the most advanced body armor in its history. Advances in wound care and trauma surgery can clearly be seen when comparing earlier conflicts with today's conflicts. In the two World Wars, for every death there were an estimated 1.7 war injuries. In Afghanistan and Iraq, there are an estimated seven injuries for every death. As of August 1, 2012, 49,000 soldiers had been wounded in the wars in Afghanistan and Iraq. Of the war injuries, a majority are attributed to IEDs. Vehicles are a high-priority target, injuring soldiers and destroying equipment and intelligence. Concussions, broken bones, brain injuries, severe burns, internal bleeding, shrapnel wounds, and loss of limbs are frequent injuries consistent with IED attacks.

Under the Department of Defense's military medicine division, the Tactical Combat Casualty Care program was established in 1996 to decrease preventable deaths through better training. For the first time, data were culled solely from combat cases, not civilian records. Although helpful in past protocols, civilian records focused on blunt trauma. Tactical Combat Casualty Care was established for penetrating wounds and longer evacuation times, allowing for better on-scene care and health outcomes in war and tactical situations. Since its implementation, killed in action and death by wound percentages have shifted positively. (Death by wound is limited to soldiers whose wounds and subsequent infection are the cause of death. Those who are wounded and die off the field are not considered to have been killed in action.) In World War II and the Vietnam War, 88%

of soldiers who died were killed in action and 12% died from wounds. As of 2006, in Afghanistan and Iraq the killed in action rates are 18.7% and 13.5%, respectively. These numbers reflect an amalgamation of new technology and medical protocols that have adapted to new military demands. On-scene treatment is better than ever before, evacuation is done quickly, and soldiers are more protected from chest and abdominal wounds by advanced body armor. Together, these elements represent cutting-edge military medicine and technology necessary to protect its soldiers.

In an effort to maintain the highest standards of military excellence, much research has been dedicated to the medical field to help wounded soldiers. The Second World War altered the medical community in very tangible ways. The specialization of physicians has led to better training and advancements. In the 20th century, there were fewer deaths from infection than from battle, a huge milestone for the military community. The decreased rate of dead-to-wounded further demonstrates the commitment to bettering the technology used to diagnose and treat injured soldiers.

YAMASHITA PRECEDENT

The Yamashita Precedent refers to commanding officers' responsibility to both refrain from committing war crimes and also stop those under their command from committing them. Under the precedent, officers ignoring and/or failing to meet this responsibility may be held responsible for war crimes even if it cannot be proven that they were aware of them. The term originates from the 1945 trial by military tribunal of General Tomoyuki Yamashita, the Japanese commander of the Philippines, who was hanged for war crimes committed by his men that he failed to prevent. The precedent has been largely superseded by more recent cases and has not been widely referenced in military legal decisions. This entry reviews the background and events of the trial and discusses its legal implications.

The Trial of Yamashita

The military tribunal tasked with trying General Yamashita convened on October 8, 1945, in downtown Manila, Philippines. The United States sought his conviction for failure to control the actions of his troops while in command of the Japanese 14th Area Army. These actions included the rape of Filipino women, destruction of private property, and the murder or abuse of more than 32,000 Filipino civilians and captured Americans. Prosecutors based their case on the grounds that Yamashita failed to control the troops under his command and, in doing

so, violated the Hague Convention of 1907 and the Geneva Red Cross Convention of 1929. With six U.S. Army officers provided as defense counsel, Yamashita pleaded "not guilty" to all counts. After his plea, an addendum of 64 specific crimes committed by his subordinates were added to the charges against Yamashita. Apart from this, the prosecution added 59 more war crimes the day the trial began without granting an extension for further defense preparations.

Once the trial began, the prosecution could not definitively prove that Yamashita ordered or had knowledge of any atrocities. Therefore, the prosecution's argument rested on the belief that Yamashita either should have been or must have been aware of the actions of his men due to the sheer scale and brutality of the crimes. The prosecution illustrated the widespread nature of the crimes by providing hundreds of witnesses to myriad atrocities. The defense contended that not only had Yamashita been unaware of his men's actions but also the poor communications during warfare made such knowledge impossible. A number of Yamashita's staff officers testified that he had not been informed of the situation.

In the final days of the trial, the defense moved for a continuance to review the latest supplemental charges, but the tribunal declined the motion. Expecting a guilty verdict, the defense dispatched an appeal to the U.S. Supreme Court and the Filipino Supreme Court before the trial's conclusion. The appeal rested mainly on the grounds that the military tribunal lacked proper jurisdiction because of reduced military authority during peacetime.

On December 7, 1945, the court handed Yamashita a guilty verdict and sentenced him to death. Following a brief stay of execution while it deliberated, the U.S. Supreme Court declined to review the case, declaring the tribunals valid as permitted by act of Congress. The Filipino Supreme Court also opted not to review the case.

The Yamashita trial generated some initial dissatisfaction and remains controversial. General Douglas MacArthur urged the tribunal to expedite the case so that justice could be delivered swiftly, setting a precedent for the upcoming war crimes trials in Tokyo. In an attempt to speed the trial along, some customary court procedures were not followed and significant hearsay evidence admitted. Justice Frank Murphy, joined by Justice Wiley Rutledge in a dissent of the U.S. Supreme Court's rejection to hear Yamashita's appeal, concluded that the Yamashita trial set a dangerous precedent by allowing any military officer or even the president of the United States to be held criminally responsible for the actions of a subordinate even if the superior could not be directly linked to the action. Nonetheless, these initial dissenters proved in the minority, and Yamashita was hanged on February 23, 1946.

Yamashita Precedent in Practice

The precedent set by Yamashita's conviction carried enormous legal implications. The precedent firmly established a commanding officer's responsibility not only to not participate or sanction war crimes but also to take positive steps to prevent them from occurring under his command. In practice, however, other cases have overruled or taken the place of the Yamashita Precedent. Shortly after Yamashita's execution, the 1947–1948 trial of Marshal Wilhelm

von Leeb challenged the Yamashita Precedent by acknowledging that battlefield complexities could serve as evidence that a commanding officer did not know of atrocities. The von Leeb trial created a precedent whereby proof of actual knowledge must be presented alongside failure to prevent or punish human rights violations. The trial of Captain Ernest Medina, the man in command of the unit that committed the My Lai massacre during the Vietnam War, further found that an officer can be held responsible for not taking action against war crimes committed by soldiers under his command, but only when he possessed knowledge of the crimes. The International Criminal Court's guidelines, adopted in 1998, also require knowledge of the crime before one can be charged with crimes against humanity or war crimes. While the principle of holding officers responsible for failure to prevent war crimes has been upheld, the more specific provisions of the Yamashita Precedent regarding prosecution based on implied knowledge has fallen out of use.

Appendix 1

CIVIL-MILITARY RELATIONS

U.S. Constitution

Ratified in 1788, the Constitution represented the second attempt by the thirteen original states of the United States of America to forge an effective national government. In contrast to the earlier Articles of Confederation, the U.S. Constitution granted Congress clear power to raise revenues in support of a national government and created a separate executive branch. The President of the United States serves as commander in chief of armed forces and is vested with the power to appoint civil and military officers, subject to the consent of the U.S. Senate. Presidential authority is checked by the granting to Congress the sole power, through appropriate legislation, to establish armed forces and enact laws to govern them. Also, only this body can levy taxes and appropriate money for the military. Although the Constitution centralizes power in the hands of the national government, it does provide for sharing power with state governments. In the case of the militia, authority is divided between the national government and the states.

We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

Article I.

Section 1.

All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives. . . .

Section 8.

The Congress shall have Power To lay and collect Taxes, Duties, Imposts and Excises, to pay the Debts and provide for the common Defence and general Welfare of the United States; but all Duties, Imposts and Excises shall be uniform throughout the United States;

To borrow Money on the credit of the United States;

To regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes;

.....

To define and punish Piracies and Felonies committed on the high Seas, and Offences against the Law of Nations;

To declare War, grant Letters of Marque and Reprisal, and make Rules concerning Captures on Land and Water;

To raise and support Armies, but no Appropriation of Money to that Use shall be for a longer Term than two Years;

To provide and maintain a Navy;

To make Rules for the Government and Regulation of the land and naval Forces;

To provide for calling forth the Militia to execute the Laws of the Union, suppress Insurrections and repel Invasions;

To provide for organizing, arming, and disciplining, the Militia, and for governing such Part of them as may be employed in the Service of the United States, reserving to the States respectively, the Appointment of the Officers, and the Authority of training the Militia according to the discipline prescribed by Congress; ...

To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof.

Section 9.

... The Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it.

No Bill of Attainder or ex post facto Law shall be passed.

Section 10.

... No State shall, without the Consent of Congress, lay any Duty of Tonnage, keep Troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign Power, or engage in War, unless actually invaded, or in such imminent Danger as will not admit of delay.

Article II.

Section 1.

The executive Power shall be vested in a President of the United States of America. He shall hold his Office during the Term of four Years, and, together with the Vice President, chosen for the same Term, be elected, as follows:

Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and Representatives to which the State may be entitled in the Congress: but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector.

The Electors shall meet in their respective States, and vote by Ballot for two Persons, of whom one at least shall not be an Inhabitant of the same State with themselves. And they shall make a List of all the Persons voted for, and of the Number of Votes for each; which List they shall sign and certify, and transmit sealed to the Seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the Presence of the Senate and House of Representatives, open all the Certificates, and the Votes shall then be counted. The Person having the greatest Number of Votes shall be the President, if such Number be a Majority of the whole Number of Electors appointed; and if there be more than one who have such Majority, and have an equal Number of Votes, then the House of Representatives shall immediately chuse by Ballot one of them for President; and if no Person have a Majority, then from the five highest on the List the said House shall in like Manner chuse the President. But in chusing the President, the Votes shall be taken by States, the Representation from each State having one Vote; A quorum for this purpose shall consist of a Member or Members from two thirds of the States, and a Majority of all the States shall be necessary to a Choice. In every Case, after the Choice of the President, the Person having the greatest Number of Votes of the Electors shall be the Vice President. But if there should remain two or more who have equal Votes, the Senate shall chuse from them by Ballot the Vice President.

The Congress may determine the Time of chusing the Electors, and the Day on which they shall give their Votes; which Day shall be the same throughout the United States.

No Person except a natural born Citizen, or a Citizen of the United States, at the time of the Adoption of this Constitution, shall be eligible to the Office of President; neither shall any Person be eligible to that Office who shall not have attained to the Age of thirty five Years, and been fourteen Years a Resident within the United States.

In Case of the Removal of the President from Office, or of his Death, Resignation, or Inability to discharge the Powers and Duties of the said Office, the Same shall devolve on the Vice President, and the Congress may by Law provide for the Case of Removal, Death, Resignation or Inability, both of the President and Vice President, declaring what Officer shall then act as President, and such Officer shall act accordingly, until the Disability be removed, or a President shall be elected.

The President shall, at stated Times, receive for his Services, a Compensation, which shall neither be increased nor diminished during the Period for which he shall have been elected, and he shall not receive within that Period any other Emolument from the United States, or any of them.

Before he enter on the Execution of his Office, he shall take the following Oath or Affirmation:—"I do solemnly swear (or affirm) that I will faithfully execute the Office of President of the United States, and will to the best of my Ability, preserve, protect and defend the Constitution of the United States."

Section 2.

The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States; he may require the Opinion, in writing, of the principal Officer in each of the executive Departments, upon any Subject relating to the Duties of their respective Offices, and he shall have Power to grant Reprieves and Pardons for Offences against the United States, except in Cases of Impeachment.

He shall have Power, by and with the Advice and Consent of the Senate, to make Treaties, provided two thirds of the Senators present concur; and he shall nominate, and by and with the Advice and Consent of the Senate, shall appoint Ambassadors, other public Ministers and Consuls, Judges of the supreme Court, and all other Officers of the United States, whose Appointments are not herein otherwise provided for, and which shall be established by Law: but the Congress may by Law vest the Appointment of such inferior Officers, as they think proper, in the President alone, in the Courts of Law, or in the Heads of Departments.

The President shall have Power to fill up all Vacancies that may happen during the Recess of the Senate, by granting Commissions which shall expire at the End of their next Session.

Section 3.

He shall from time to time give to the Congress Information of the State of the Union, and recommend to their Consideration such Measures as he shall judge necessary and expedient; he may, on extraordinary Occasions, convene both Houses, or either of them, and in Case of Disagreement between them, with Respect to the Time of Adjournment, he may adjourn them to such Time as he shall think proper; he shall receive Ambassadors and other public Ministers; he shall take Care that the Laws be faithfully executed, and shall Commission all the Officers of the United States.

Section 4.

The President, Vice President and all civil Officers of the United States, shall be removed from Office on Impeachment for, and Conviction of, Treason, Bribery, or other high Crimes and Misdemeanors.

Article III

Section 2.

. . . The Trial of all Crimes, except in Cases of Impeachment, shall be by Jury; and such Trial shall be held in the State where the said Crimes shall have been committed; but when not committed within any State, the Trial shall be at such Place or Places as the Congress may by Law have directed.

Section 3.

Treason against the United States, shall consist only in levying War against them, or in adhering to their Enemies, giving them Aid and Comfort. No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on Confession in open Court.

The Congress shall have Power to declare the Punishment of Treason, but no Attainder of Treason shall work Corruption of Blood, or Forfeiture except during the Life of the Person attainted.

Article IV.**Section 4.**

The United States shall guarantee to every State in this Union a Republican Form of Government, and shall protect each of them against Invasion; and on Application of the Legislature, or of the Executive (when the Legislature cannot be convened), against domestic Violence.

This Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States, shall be the supreme Law of the Land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding.

Article VI.

... The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers, both of the United States and of the several States, shall be bound by Oath or Affirmation, to support this Constitution; but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States.

Article VII.

The Ratification of the Conventions of nine States, shall be sufficient for the Establishment of this Constitution between the States so ratifying the Same.

Amendment I

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

Amendment II

A well regulated Militia, being necessary to the security of a free State, the right of the people to keep and bear Arms, shall not be infringed.

Amendment III

No Soldier shall, in time of peace be quartered in any house, without the consent of the Owner, nor in time of war, but in a manner to be prescribed by law.

Amendment IV

The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no Warrants shall issue, but upon probable cause, supported by Oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

Amendment V

No person shall be held to answer for a capital, or otherwise infamous crime, unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the Militia, when in actual

service in time of War or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use, without just compensation.

Amendment VI

In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the Assistance of Counsel for his defence.

Amendment VII

In Suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury, shall be otherwise re-examined in any Court of the United States, than according to the rules of the common law.

Amendment VIII

Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted.

Amendment IX

The enumeration in the Constitution, of certain rights, shall not be construed to deny or disparage others retained by the people.

Amendment X

The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

Naturalization Oath of Allegiance to the United States

"I hereby declare, on oath, that I absolutely and entirely renounce and abjure all allegiance and fidelity to any foreign prince, potentate, state or sovereignty, of whom or which I have heretofore been a subject or citizen; that I will support and defend the Constitution and laws of the United States of America against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; that I will bear arms on behalf of the United States when required by the law; that I will perform noncombatant service in the armed forces of the United States when required by the law; that I will perform work of national importance under civilian direction when required by the law; and that I take this obligation freely without any mental reservation or purpose of evasion; so help me God."

United Nations Charter Excerpts

Until 1945, the United States heeded George Washington's call to avoid entangling alliances outside of the western hemisphere. By establishing and joining the United Nations in 1945, the United States committed itself

to collective security in order to preserve international peace and stability. Under the United Nations system, power is concentrated in the hands of the United Nations Security Council, where the great powers of World War II—the United States, Great Britain, Russia, China, and France—continue to exercise an absolute veto over the actions of this body. The veto ensures that the UN can take action in matters of war and peace only with consent of the United States and the other major powers. Twice, the United States has entered a major armed conflict based on UN Security Council Resolutions: the Korean War in 1950 and the Persian Gulf War in 1991. U.S. forces have also served in a number of UN peacekeeping operations authorized by the Security Council. In 2003, the Security Council, after a heated debate, refused to authorize the U.S. invasion of Iraq.

WE THE PEOPLES OF THE UNITED NATIONS DETERMINED to save succeeding generations from the scourge of war, which twice in our lifetime has brought untold sorrow to mankind, and to reaffirm faith in fundamental human rights, in the dignity and worth of the human person, in the equal rights of men and women and of nations large and small, and to establish conditions under which justice and respect for the obligations arising from treaties and other sources of international law can be maintained, and to promote social progress and better standards of life in larger freedom, AND FOR THESE ENDS to practice tolerance and live together in peace with one another as good neighbours, and to unite our strength to maintain international peace and security, and to ensure, by the acceptance of principles and the institution of methods, that armed force shall not be used, save in the common interest, and to employ international machinery for the promotion of the economic and social advancement of all peoples, HAVE RESOLVED TO COMBINE OUR EFFORTS TO ACCOMPLISH THESE AIMS. Accordingly, our respective Governments, through representatives assembled in the city of San Francisco, who have exhibited their full powers found to be in good and due form, have agreed to the present Charter of the United Nations and do hereby establish an international organization to be known as the United Nations.

Chapter I: Purposes and Principles

Article 1

The Purposes of the United Nations are:

1. To maintain international peace and security, and to that end: to take effective collective measures for the prevention and removal of threats to the peace, and for the suppression of acts of aggression or other breaches of the peace, and to bring about by peaceful means, and in conformity with the principles of justice and international law, adjustment or settlement of international disputes or situations which might lead to a breach of the peace;
2. To develop friendly relations among nations based on respect for the principle of equal rights and self-determination of peoples, and to take other appropriate measures to strengthen universal peace;
3. To achieve international co-operation in solving international problems of an economic, social, cultural, or humanitarian character, and in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion; and
4. To be a centre for harmonizing the actions of nations in the attainment of these common ends.

Article 2

The Organization and its Members, in pursuit of the Purposes stated in Article 1, shall act in accordance with the following Principles.

1. The Organization is based on the principle of the sovereign equality of all its Members.
2. All Members, in order to ensure to all of them the rights and benefits resulting from membership, shall fulfill in good faith the obligations assumed by them in accordance with the present Charter.

3. All Members shall settle their international disputes by peaceful means in such a manner that international peace and security, and, justice, are not endangered.
4. All Members shall refrain in their international relations from the threat or use of force against the territorial integrity or political independence of any state, or in any other manner inconsistent with the Purposes of the United Nations.
5. All Members shall give the United Nations every assistance in any action it takes in accordance with the present Charter, and shall refrain from giving assistance to any state against which the United Nations is taking preventive or enforcement action.
6. The Organization shall ensure that states which are not Members of the United Nations act in accordance with these Principles so far as may be necessary for the maintenance of international peace and security.
7. Nothing contained in the present Charter shall authorize the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state or shall require the Members to submit such matters to settlement under the present Charter; but this principle shall not prejudice the application of enforcement measures under Chapter VII.

Chapter II: Membership

Article 3

The original Members of the United Nations shall be the states which, having participated in the United Nations Conference on International Organization at San Francisco, or having previously signed the Declaration by United Nations of 1 January 1942, sign the present Charter and ratify it in accordance with Article 110.

Article 4

1. Membership in the United Nations is open to all other peace-loving states which accept the obligations contained in the present Charter and, in the judgment of the Organization, are able and willing to carry out these obligations.
2. The admission of any such state to membership in the Nations will be effected by a decision of the General Assembly upon the recommendation of the Security Council.

Article 5

A Member of the United Nations against which preventive or enforcement action has been taken by the Security Council may be suspended from the exercise of the rights and privileges of membership by the General Assembly upon the recommendation of the Security Council. The exercise of these rights and privileges may be restored by the Security Council.

Article 6

A Member of the United Nations which has persistently violated the Principles contained in the present Charter may be expelled from the Organization by the General Assembly upon the recommendation of the Security Council.

Chapter III: Organs

Article 7

1. There are established as the principal organs of the United Nations: a General Assembly, a Security Council, an Economic and Social Council, a Trusteeship Council, an International Court of Justice, and a Secretariat.
2. Such subsidiary organs as may be found necessary may be established in accordance with the present Charter.

Article 8

The United Nations shall place no restrictions on the eligibility of men and women to participate in any capacity and under conditions of equality in its principal and subsidiary organs.

Chapter IV: The General Assembly**Composition****Article 9**

1. The General Assembly shall consist of all the Members of the United Nations.
2. Each Member shall have not more than five representatives in the General Assembly.

Functions and Powers**Article 10**

The General Assembly may discuss any questions or any matters within the scope of the present Charter or relating to the powers and functions of any organs provided for in the present Charter, and, except as provided in Article 12, may make recommendations to the Members of the United Nations or to the Security Council or to both on any such questions or matters.

Article 11

1. The General Assembly may consider the general principles of co-operation in the maintenance of international peace and security, including the principles governing disarmament and the regulation of armaments, and may make recommendations with regard to such principles to the Members or to the Security Council or to both.
2. The General Assembly may discuss any questions relating to the maintenance of international peace and security brought before it by any Member of the United Nations, or by the Security Council, or by a state which is not a Member of the United Nations in accordance with Article 35, paragraph 2, and, except as provided in Article 12, may make recommendations with regard to any such questions to the state or states concerned or to the Security Council or to both. Any such question on which action is necessary shall be referred to the Security Council by the General Assembly either before or after discussion.
3. The General Assembly may call the attention of the Security Council to situations which are likely to endanger international peace and security.
4. The powers of the General Assembly set forth in this Article shall not limit the general scope of Article 10.

Article 12

1. While the Security Council is exercising in respect of any dispute or situation the functions assigned to it in the present Charter, the General Assembly shall not make any recommendation with regard to that dispute or situation unless the Security Council so requests.
2. The Secretary-General, with the consent of the Security Council, shall notify the General Assembly at each session of any matters relative to the maintenance of international peace and security which are being dealt with by the Security Council and similarly notify the General Assembly, or the Members of the United Nations if the General Assembly is not in session, immediately the Security Council ceases to deal with such matters.

Chapter V: The Security Council**Composition****Article 23**

1. The Security Council shall consist of fifteen Members of the United Nations. The Republic of China, France, the Union of Soviet Socialist , the United Kingdom of Great Britain and Northern Ireland, and the

United States of America shall be permanent members of the Security Council. The General Assembly shall elect ten other Members of the United Nations to be non-permanent members of the Security Council, due regard being specially paid, in the first instance to the contribution of Members of the United Nations to the maintenance of international peace and security and to the other purposes of the Organization, and also to equitable geographical distribution.

2. The non-permanent members of the Security Council shall be elected for a term of two years. In the first election of the non-permanent members after the increase of the membership of the Security Council from eleven to fifteen, two of the four additional members shall be chosen for a term of one year. A retiring member shall not be eligible for immediate re-election.
3. Each member of the Security Council shall have one representative.

Functions and Powers

Article 24

1. In order to ensure prompt and effective action by the United Nations, its Members confer on the Security Council primary responsibility for the maintenance of international peace and security, and agree that in carrying out its duties under this responsibility the Security Council acts on their behalf.
2. In discharging these duties the Security Council shall act in accordance with the Purposes and Principles of the United Nations. The specific powers granted to the Security Council for the discharge of these duties are laid down in Chapters VI, VII, VIII, and XII.
3. The Security Council shall submit annual and, when necessary, special reports to the General Assembly for its consideration.

Article 25

The Members of the United Nations agree to accept and carry out the decisions of the Security Council in accordance with the present Charter.

Article 26

In order to promote the establishment and maintenance of international peace and security with the least diversion for armaments of the world's human and economic resources, the Security Council shall be responsible for formulating, with the assistance of the Military Staff Committee referred to in Article 47, plans to be submitted to the Members of the United Nations for the establishment of a system for the regulation of armaments.

Voting

Article 27

1. Each member of the Security Council shall have one vote.
2. Decisions of the Security Council on procedural matters shall be made by an affirmative vote of nine members.
3. Decisions of the Security Council on all other matters shall be made by an affirmative vote of nine members including the concurring votes of the permanent members; provided that, in decisions under Chapter VI, and under paragraph 3 of Article 52, a party to a dispute shall abstain from voting.

Procedure

Article 28

1. The Security Council shall be so organized as to be able to function continuously. Each member of the Security Council shall for this purpose be represented at times at the seat of the Organization.

2. The Security Council shall hold meetings at which each of its members may, if it so desires, be represented by a member of the government or by some other specially designated representative.
3. The Security Council may hold meetings at such places other than the seat of the Organization as in its judgment will best facilitate its work.

Article 29

The Security Council may establish such subsidiary organs as it deems necessary for the performance of its functions.

Article 30

The Security Council shall adopt its own rules of procedure, including the method of selecting its President.

Article 31

Any Member of the United Nations which is not a member of the Security Council may participate, without vote, in the discussion of any question brought before the Security Council whenever the latter considers that the interests of that Member are specially affected.

Article 32

Any Member of the United Nations which is not a member of the Security Council or any state which is not a Member of the United Nations, if it is a party to a dispute under consideration by the Security Council, shall be invited to participate, without vote, in the discussion relating to the dispute. The Security Council shall lay down such conditions as it deems just for the participation of a state which is not a Member of the United Nations.

Chapter VI: Pacific Settlement of Disputes

Article 33

1. The parties to any dispute, the continuance of which is likely to endanger the maintenance of international peace and security, shall, first of all, seek a solution by negotiation, enquiry, mediation, conciliation, arbitration, judicial settlement, resort to regional agencies or arrangements, or other peaceful means of their own choice.
2. The Security Council shall, when it deems necessary, call upon the parties to settle their dispute by such means.

Article 34

The Security Council may investigate any dispute, or any situation which might lead to international friction or give rise to a dispute, in order to determine whether the continuance of the dispute or situation is likely to endanger the maintenance of international peace and security.

Article 35

1. Any Member of the United Nations may bring any dispute, or any situation of the nature referred to in Article 34, to the attention of the Security Council or of the General Assembly.
2. A state which is not a Member of the United Nations may bring to the attention of the Security Council or of the General Assembly any dispute to which it is a party if it accepts in advance, for the purposes of the dispute, the obligations of pacific settlement provided in the present Charter.
3. The proceedings of the General Assembly in respect of matters brought to its attention under this Article will be subject to the provisions of Articles 11 and 12.

Article 36

1. The Security Council may, at any stage of a dispute of the nature referred to in Article 33 or of a situation of like nature, recommend appropriate procedures or methods of adjustment.
2. The Security Council should take into consideration any procedures for the settlement of the dispute which have already been adopted by the parties.
3. In making recommendations under this Article the Security Council should also take into consideration that legal disputes should as a general rule be referred by the parties to the International Court of Justice in accordance with the provisions of the Statute of the Court.

Article 37

1. Should the parties to a dispute of the nature referred to in Article 33 fail to settle it by the means indicated in that Article, they shall refer it to the Security Council.
2. If the Security Council deems that the continuance of the dispute is in fact likely to endanger the maintenance of international peace and security, it shall decide whether to take action under Article 36 or to recommend such terms of settlement as it may consider appropriate.

Article 38

Without prejudice to the provisions of Articles 33 to 37, the Security Council may, if all the parties to any dispute so request, make recommendations to the parties with a view to a pacific settlement of the dispute.

Chapter VII: Action With Respect to Threats to the Peace, Breaches of the Peace, and Acts of Aggression

Article 39

The Security Council shall determine the existence of any threat to the peace, breach of the peace, or act of aggression and shall make recommendations, or decide what measures shall be taken in accordance with Articles 4 and 42, to maintain or restore international peace and security.

Article 40

In order to prevent an aggravation of the situation, the Security Council may, before making the recommendations or deciding upon the measures provided for in Article 39, call upon the parties concerned to comply with such provisional measures as it deems necessary or desirable. Such provisional measures shall be without prejudice to the rights, claims, or position of the parties concerned. The Security Council shall duly take account of failure to comply with such provisional measures.

Article 41

The Security Council may decide what measures not involving the use of armed force are to be employed to give effect to its decisions, and it may call upon the Members of the United Nations to apply such measures. These may include complete or partial interruption of economic relations and of rail, sea, air, postal, telegraphic, radio, and other means of communication, and the severance of diplomatic relations.

Article 42

Should the Security Council consider that measures provided for in Article 41 would be inadequate or have proved to be inadequate, it may take such action by air, sea, or land forces as may be necessary to maintain or restore international peace and security. Such action may include demonstrations, blockade, and other operations by air, sea, or land forces of Members of the United Nations.

Article 43

1. All Members of the United Nations, in order to contribute to the maintenance of international peace and security, undertake to make available to the Security Council, on its call and in accordance with a special agreement or agreements, armed forces, assistance, and facilities, including rights of passage, necessary for the purpose of maintaining international peace and security.
2. Such agreement or agreements shall govern the numbers and types of forces, their degree of readiness and general location, and the nature of the facilities and assistance to be provided.
3. The agreement or agreements shall be negotiated as soon as possible on the initiative of the Security Council. They shall be concluded between the Security Council and Members or between the Security Council and groups of Members and shall be subject to ratification by the signatory states in accordance with their respective constitutional processes.

Article 44

When the Security Council has decided to use force it shall, before calling upon a Member not represented on it to provide armed forces in fulfilment of the obligations assumed under Article 43, invite that Member, if the Member so desires, to participate in the decisions of the Security Council concerning the employment of contingents of that Member's armed forces.

Article 45

In order to enable the Nations to take urgent military measures, Members shall hold immediately available national air-force contingents for combined international enforcement action. The strength and degree of readiness of these contingents and plans for their combined action shall be determined, within the limits laid down in the special agreement or agreements referred to in Article 43, by the Security Council with the assistance of the Military Committee.

Article 46

Plans for the application of armed force shall be made by the Security Council with the assistance of the Military Staff Committee.

Article 47

1. There shall be established a Military Staff Committee to advise and assist the Security Council on questions relating to the Security Council's military requirements for the maintenance of international peace and security, the employment and command of forces placed at its disposal, the regulation of armaments, and possible disarmament.
2. The Military Staff Committee consist of the Chiefs of Staff of the permanent members of the Security Council or their representatives. Any Member of the United Nations not permanently represented on the Committee shall be invited by the Committee to be associated with it when the efficient discharge of the Committee's responsibilities requires the participation of that Member in its work.
3. The Military Staff Committee be responsible under the Security Council for the strategic direction of any armed forces placed at the disposal of the Security Council. Questions relating to the command of such forces shall be worked out subsequently.
4. The Military Staff Committee, with the authorization of the security Council and after consultation with appropriate regional agencies, may establish sub-committees.

Article 48

1. The action required to carry out the decisions of the Security Council for the maintenance of international peace and security shall be taken by all the Members of the United Nations or by some of them, as the Security Council may determine.

2. Such decisions shall be carried out by the Members of the United Nations directly and through their action in the appropriate international agencies of which they are members.

Article 49

The Members of the United Nations shall join in affording mutual assistance in carrying out the measures decided upon by the Security Council.

Article 50

If preventive or enforcement measures against any state are taken by the Security Council, any other state, whether a Member of the United Nations or not, which finds itself confronted with special economic problems arising from the carrying out of those measures shall have the right to consult the Security Council with regard to a solution of those problems.

Article 51

Nothing in the present Charter shall impair the inherent right of individual or collective self-defence if an armed attack occurs against a Member of the United Nations, until the Security Council has taken measures necessary to maintain international peace and security. Measures taken by Members in the exercise of this right of self-defence shall be immediately reported to the Security Council and shall not in any way affect the authority and responsibility of the Security Council under the present Charter to take at any time such action as it deems necessary in order to maintain or restore international peace and security.

Chapter VIII: Regional Arrangements

Article 52

1. Nothing in the present Charter precludes the existence of regional arrangements or agencies for dealing with such matters relating to the maintenance of international peace and security as are appropriate for regional action, provided that such arrangements or agencies and their activities are consistent with the Purposes and Principles of the United Nations.
2. The Members of the United Nations entering into such arrangements or constituting such agencies shall make every effort to achieve pacific settlement of local disputes through such regional arrangements or by such regional agencies before referring them to the Security Council.
3. The Security Council shall encourage the development of pacific settlement of local disputes through such regional arrangements or by such regional agencies either on the initiative of the states concerned or by reference from the Security Council.
4. This Article in no way impairs the application of Articles 34 and 35.

Article 53

1. The Security Council shall, where appropriate, utilize such regional arrangements or agencies for enforcement action under its authority. But no enforcement action shall be taken under regional arrangements or by regional agencies without the authorization of the Security Council, with the exception of measures against any enemy state, as defined in paragraph 2 of this Article, provided for pursuant to Article 107 or in regional arrangements directed against renewal of aggressive policy on the part of any such state, until such time as the Organization may, on request of the Governments concerned, be charged with the responsibility for preventing further aggression by such a state.
2. The term enemy state as used in paragraph 1 of this Article applies to any state which during the Second World War has been an enemy of any signatory of the present Charter.

Article 54

The Security Council shall at all times be kept fully informed of activities undertaken or in contemplation under regional arrangements or by regional agencies for the maintenance of international peace and security.

Chapter XV: The Secretariat*Article 97*

The Secretariat shall comprise a Secretary-General and such staff as the Organization may require. The Secretary-General shall be appointed by the General Assembly upon the recommendation of the Security Council. He shall be the chief administrative officer of the Organization.

Article 98

The Secretary-General shall act in that capacity in all meetings of the General Assembly, of the Security Council, of the Economic and Social Council, and of the Trusteeship Council, and shall perform such other functions as are entrusted to him by these organs. The Secretary-General shall make an annual report to the General Assembly on the work of the Organization.

Article 99

The Secretary-General may bring to the attention of the Security Council any matter which in his opinion may threaten the maintenance of international peace and security.

North Atlantic Treaty

The North Atlantic Treaty is the United States' most important political and military alliance. Initially designed to deter a Soviet invasion of Western Europe during the Cold War, the North Atlantic Treaty Organization (NATO) that grew out of this treaty created a military alliance with a unified command. Since the organization's founding, an American general has always served as supreme commander of NATO's forces, with a European civilian serving as the organization's Secretary General. During the Cold War, NATO forces prepared for armed conflict, but only after the collapse of the Soviet Union did NATO engage in military operations in the Balkans and Afghanistan. After 9/11, NATO countries formally evoked the treaty and sent armed surveillance planes to the United States.

Washington D.C., 4 April 1949

The Parties to this Treaty reaffirm their faith in the purposes and principles of the Charter of the United Nations and their desire to live in peace with all peoples and all governments.

They are determined to safeguard the freedom, common heritage and civilisation of their peoples, founded on the principles of democracy, individual liberty and the rule of law. They seek to promote stability and well-being in the North Atlantic area.

They are resolved to unite their efforts for collective defence and for the preservation of peace and security. They therefore agree to this North Atlantic Treaty:

Article 1

The Parties undertake, as set forth in the Charter of the United Nations, to settle any international dispute in which they may be involved by peaceful means in such a manner that international peace and security and justice are not endangered, and to refrain in their international relations from the threat or use of force in any manner inconsistent with the purposes of the United Nations.

Article 2

The Parties will contribute toward the further development of peaceful and friendly international relations by strengthening their free institutions, by bringing about a better understanding of the principles upon which these institutions are founded, and by promoting conditions of stability and well-being. They will seek to eliminate conflict in their international economic policies and will encourage economic collaboration between any or all of them.

Article 3

In order more effectively to achieve the objectives of this Treaty, the Parties, separately and jointly, by means of continuous and effective self-help and mutual aid, will maintain and develop their individual and collective capacity to resist armed attack.

Article 4

The Parties will consult together whenever, in the opinion of any of them, the territorial integrity, political independence or security of any of the Parties is threatened.

Article 5

The Parties agree that an armed attack against one or more of them in Europe or North America shall be considered an attack against them all and consequently they agree that, if such an armed attack occurs, each of them, in exercise of the right of individual or collective self-defence recognised by Article 51 of the Charter of the United Nations, will assist the Party or Parties so attacked by taking forthwith, individually and in concert with the other Parties, such action as it deems necessary, including the use of armed force, to restore and maintain the security of the North Atlantic area.

Any such armed attack and all measures taken as a result thereof shall immediately be reported to the Security Council. Such measures shall be terminated when the Security Council has taken the measures necessary to restore and maintain international peace and security.

Article 6¹

For the purpose of Article 5, an armed attack on one or more of the Parties is deemed to include an armed attack:

- on the territory of any of the Parties in Europe or North America, on the Algerian Departments of France,² on the territory of or on the Islands under the jurisdiction of any of the Parties in the North Atlantic area north of the Tropic of Cancer;
- on the forces, vessels, or aircraft of any of the Parties, when in or over these territories or any other area in Europe in which occupation forces of any of the Parties were stationed on the date when the Treaty entered into force or the Mediterranean Sea or the North Atlantic area north of the Tropic of Cancer.

Article 7

This Treaty does not affect, and shall not be interpreted as affecting in any way the rights and obligations under the Charter of the Parties which are members of the United Nations, or the primary responsibility of the Security Council for the maintenance of international peace and security.

Article 8

Each Party declares that none of the international engagements now in force between it and any other of the Parties or any third State is in conflict with the provisions of this Treaty, and undertakes not to enter into any international engagement in conflict with this Treaty.

Article 9

The Parties hereby establish a Council, on which each of them shall be represented, to consider matters concerning the implementation of this Treaty. The Council shall be so organised as to be able to meet promptly at any time. The Council shall set up such subsidiary bodies as may be necessary; in particular it shall establish immediately a defence committee which shall recommend measures for the implementation of Articles 3 and 5.

Article 10

The Parties may, by unanimous agreement, invite any other European State in a position to further the principles of this Treaty and to contribute to the security of the North Atlantic area to accede to this Treaty. Any State so invited may become a Party to the Treaty by depositing its instrument of accession with the Government of the United States of America. The Government of the United States of America will inform each of the Parties of the deposit of each such instrument of accession.

Article 11

This Treaty shall be ratified and its provisions carried out by the Parties in accordance with their respective constitutional processes. The instruments of ratification shall be deposited as soon as possible with the Government of the United States of America, which will notify all the other signatories of each deposit. The Treaty shall enter into force between the States which have ratified it as soon as the ratifications of the majority of the signatories, including the ratifications of Belgium, Canada, France, Luxembourg, the Netherlands, the United Kingdom and the United States, have been deposited and shall come into effect with respect to other States on the date of the deposit of their ratifications.³

Article 12

After the Treaty has been in force for ten years, or at any time thereafter, the Parties shall, if any of them so requests, consult together for the purpose of reviewing the Treaty, having regard for the factors then affecting peace and security in the North Atlantic area, including the development of universal as well as regional arrangements under the Charter of the United Nations for the maintenance of international peace and security.

Article 13

After the Treaty has been in force for twenty years, any Party may cease to be a Party one year after its notice of denunciation has been given to the Government of the United States of America, which will inform the Governments of the other Parties of the deposit of each notice of denunciation.

Article 14

This Treaty, of which the English and French texts are equally authentic, shall be deposited in the archives of the Government of the United States of America. Duly certified copies will be transmitted by that Government to the Governments of other signatories.

Notes

1. The definition of the territories to which Article 5 applies was revised by Article 2 of the Protocol to the North Atlantic Treaty on the accession of Greece and Turkey signed on 22 October 1951.
2. On January 16, 1963, the North Atlantic Council noted that insofar as the former Algerian Departments of France were concerned, the relevant clauses of this Treaty had become inapplicable as from July 3, 1962.
3. The Treaty came into force on 24 August 1949, after the deposition of the ratifications of all signatory states.

War Powers Act of 1973

Joint Resolution: Concerning the War Powers of Congress and the President

Resolved by the Senate and the House of Representatives of the United States of America in Congress assembled,

Short Title

SEC. 1. This joint resolution may be cited as the “War Powers Resolution.”

Purpose and Policy

SEC. 2. (a) It is the purpose of this joint resolution to fulfill the intent of the framers of the Constitution of the United States and insure that the collective judgement of both the Congress and the President will apply to the introduction of United States Armed Forces into hostilities, or into situations where imminent involvement in hostilities is clearly indicated by the circumstances, and to the continued use of such forces in hostilities or in such situations.

(b) Under article I, section 8, of the Constitution, it is specifically provided that the Congress shall have the power to make all laws necessary and proper for carrying into execution, not only its own powers but also all other powers vested by the Constitution in the Government of the United States, or in any department or officer thereof.

(c) The constitutional powers of the President as Commander-in-Chief to introduce United States Armed Forces into hostilities, or into situations where imminent involvement in hostilities is clearly indicated by the circumstances, are exercised only pursuant to (1) a declaration of war, (2) specific statutory authorization, or (3) a national emergency created by attack upon the United States, its territories or possessions, or its armed forces.

Consultation

SEC. 3. The President in every possible instance shall consult with Congress before introducing United States Armed Forces into hostilities or into situation where imminent involvement in hostilities is clearly indicated by the circumstances, and after every such introduction shall consult regularly with the Congress until United States Armed Forces are no longer engaged in hostilities or have been removed from such situations.

Reporting

SEC. 4. (a) In the absence of a declaration of war, in any case in which United States Armed Forces are introduced—

- (1) into hostilities or into situations where imminent involvement in hostilities is clearly indicated by the circumstances;
- (2) into the territory, airspace or waters of a foreign nation, while equipped for combat, except for deployments which relate solely to supply, replacement, repair, or training of such forces; or
- (3) in numbers which substantially enlarge United States Armed Forces equipped for combat already located in a foreign nation; the president shall submit within 48 hours to the Speaker of the House of Representatives and to the President pro tempore of the Senate a report, in writing, setting forth—
 - (A) the circumstances necessitating the introduction of United States Armed Forces;
 - (B) the constitutional and legislative authority under which such introduction took place; and
 - (C) the estimated scope and duration of the hostilities or involvement.

(b) The President shall provide such other information as the Congress may request in the fulfillment of its constitutional responsibilities with respect to committing the Nation to war and to the use of United States Armed Forces abroad

(c) Whenever United States Armed Forces are introduced into hostilities or into any situation described in subsection (a) of this section, the President shall, so long as such armed forces continue to be engaged in such hostilities or situation, report to the Congress periodically on the status of such hostilities or situation as well as on the scope and duration of such hostilities or situation, but in no event shall he report to the Congress less often than once every six months.

Congressional Action

SEC. 5. (a) Each report submitted pursuant to section 4(a)(1) shall be transmitted to the Speaker of the House of Representatives and to the President pro tempore of the Senate on the same calendar day. Each report so transmitted shall be referred to the Committee on Foreign Affairs of the House of Representatives and to the Committee on Foreign Relations of the Senate for appropriate action. If, when the report is transmitted, the Congress has adjourned sine die or has adjourned for any period in excess of three calendar days, the Speaker of the House of Representatives and the President pro tempore of the Senate, if they deem it advisable (or if petitioned by at least 30 percent of the membership of their respective Houses) shall jointly request the President to convene Congress in order that it may consider the report and take appropriate action pursuant to this section.

(b) Within sixty calendar days after a report is submitted or is required to be submitted pursuant to section 4(a)(1), whichever is earlier, the President shall terminate any use of United States Armed Forces with respect to which such report was submitted (or required to be submitted), unless the Congress (1) has declared war or has enacted a specific authorization for such use of United States Armed Forces, (2) has extended by law such sixty-day period, or (3) is physically unable to meet as a result of an armed attack upon the United States. Such sixty-day period shall be extended for not more than an additional thirty days if the President determines and certifies to the Congress in writing that unavoidable military necessity respecting the safety of United States Armed Forces requires the continued use of such armed forces in the course of bringing about a prompt removal of such forces.

(c) Notwithstanding subsection (b), at any time that United States Armed Forces are engaged in hostilities outside the territory of the United States, its possessions and territories without a declaration of war or specific statutory authorization, such forces shall be removed by the President if the Congress so directs by concurrent resolution.

Congressional Priority Procedures for Joint Resolution or Bill

SEC. 6. (a) Any joint resolution or bill introduced pursuant to section 5(b) at least thirty calendar days before the expiration of the sixty-day period specified in such section shall be referred to the Committee on Foreign Affairs of the House of Representatives or the Committee on Foreign Relations of the Senate, as the case may be, and such committee shall report one such joint resolution or bill, together with its recommendations, not later than twenty-four calendar days before the expiration of the sixty-day period specified in such section, unless such House shall otherwise determine by the yeas and nays.

(b) Any joint resolution or bill so reported shall become the pending business of the House in question (in the case of the Senate the time for debate shall be equally divided between the proponents and the opponents), and shall be voted on within three calendar days thereafter, unless such House shall otherwise determine by yeas and nays.

(c) Such a joint resolution or bill passed by one House shall be referred to the committee of the other House named in subsection (a) and shall be reported out not later than fourteen calendar days before the expiration of the sixty-day period specified in section 5(b). The joint resolution or bill so reported shall become the pending business of the House in question and shall be voted on within three calendar days after it has been reported, unless such House shall otherwise determine by yeas and nays.

(d) In the case of any disagreement between the two Houses of Congress with respect to a joint resolution or bill passed by both Houses, conferees shall be promptly appointed and the committee of conference shall make and file a report with respect to such resolution or bill not later than four calendar days before the expiration of the sixty-day period specified in section 5(b). In the event the conferees are unable to agree within 48 hours, they shall report back to their respective Houses in disagreement. Notwithstanding any rule in either House concerning the printing of conference reports in the Record or concerning any delay in the consideration of such reports, such report shall be acted on by both Houses not later than the expiration of such sixty-day period.

Congressional Priority Procedures for Concurrent Resolution

SEC. 7. (a) Any concurrent resolution introduced pursuant to section 5(b) at least thirty calendar days before the expiration of the sixty-day period specified in such section shall be referred to the Committee on Foreign Affairs of the House of Representatives or the Committee on Foreign Relations of the Senate, as the case may be, and one such concurrent resolution shall be reported out by such committee together with its recommendations within fifteen calendar days, unless such House shall otherwise determine by the yeas and nays.

(b) Any concurrent resolution so reported shall become the pending business of the House in question (in the case of the Senate the time for debate shall be equally divided between the proponents and the opponents), and shall be voted on within three calendar days thereafter, unless such House shall otherwise determine by yeas and nays.

(c) Such a concurrent resolution passed by one House shall be referred to the committee of the other House named in subsection (a) and shall be reported out by such committee together with its recommendations within fifteen calendar days and shall thereupon become the pending business of such House and shall be voted on within three calendar days after it has been reported, unless such House shall otherwise determine by yeas and nays.

(d) In the case of any disagreement between the two Houses of Congress with respect to a concurrent resolution passed by both Houses, conferees shall be promptly appointed and the committee of conference shall make and file a report with respect to such concurrent resolution within six calendar days after the legislation is referred to the committee of conference. Notwithstanding any rule in either House concerning the printing of conference reports in the Record or concerning any delay in the consideration of such reports, such report shall be acted on by both Houses not later than six calendar days after the conference report is filed. In the event the conferees are unable to agree within 48 hours, they shall report back to their respective Houses in disagreement.

Interpretation of Joint Resolution

SEC. 8. (a) Authority to introduce United States Armed Forces into hostilities or into situations wherein involvement in hostilities is clearly indicated by the circumstances shall not be inferred—

- (1) from any provision of law (whether or not in effect before the date of the enactment of this joint resolution), including any provision contained in any appropriation Act, unless such provision specifically authorizes the introduction of United States Armed Forces into hostilities or into such situations and stating that it is intended to constitute specific statutory authorization within the meaning of this joint resolution; or
- (2) from any treaty heretofore or hereafter ratified unless such treaty is implemented by legislation specifically authorizing the introduction of United States Armed Forces into hostilities or into such situations and stating that it is intended to constitute specific statutory authorization within the meaning of this joint resolution.

(b) Nothing in this joint resolution shall be construed to require any further specific statutory authorization to permit members of United States Armed Forces to participate jointly with members of the armed forces of one or more foreign countries in the headquarters operations of high-level military commands which were established prior to the date of enactment of this joint resolution and pursuant to the United Nations Charter or any treaty ratified by the United States prior to such date.

(c) For purposes of this joint resolution, the term “introduction of United States Armed Forces” includes the assignment of member of such armed forces to command, coordinate, participate in the movement of, or accompany the regular or irregular military forces of any foreign country or government when such military forces are engaged, or there exists an imminent threat that such forces will become engaged, in hostilities.

(d) Nothing in this joint resolution—

(1) is intended to alter the constitutional authority of the Congress or of the President, or the provision of existing treaties; or

(2) shall be construed as granting any authority to the President with respect to the introduction of United States Armed Forces into hostilities or into situations wherein involvement in hostilities is clearly indicated by the circumstances which authority he would not have had in the absence of this joint resolution.

Separability Clause

SEC. 9. If any provision of this joint resolution or the application thereof to any person or circumstance is held invalid, the remainder of the joint resolution and the application of such provision to any other person or circumstance shall not be affected thereby.

Effective Date

SEC. 10. This joint resolution shall take effect on the date of its enactment.

CARL ALBERT

Speaker of the House of Representatives.

JAMES O. EASTLAND

President of the Senate pro tempore.

In the House of Representatives, U.S.

November 7, 1973

The House of Representatives having proceeded to reconsider the resolution (H. J. Res 542) entitled “Joint resolution concerning the war powers of Congress and the President”, returned by the President of the United States with his objections, to the House of Representatives, in which it originated, it was

Resolved, That the said resolution pass, two-thirds of the House of Representatives agreeing to pass the same.

Attest:

W. PAT JENNINGS

Clerk.

I certify that this Joint Resolution originated in the House of Representatives.

W. PAT JENNINGS

Clerk.

*In The Senate of The United States**November 7, 1973*

The Senate having proceeded to reconsider the joint resolution (H. J. Res. 542) entitled “Joint resolution concerning the war powers of Congress and the President”, returned by the President of the United States with his objections to the House of Representatives, in which it originate, it was

Resolved, That the said joint resolution pass, two-thirds of the Senators present having voted in the affirmative.

Attest:

FRANCIS R. VALEO

Secretary.

Goldwater Nichols Department of Defense Reorganization Act of 1986

On October 1, 1986, the 99th U.S. Congress passed Public Law 99-433, the Goldwater-Nichols Department of Defense Reorganization Act, which was sponsored by Senator Barry Goldwater and Representative Bill Nichols, The purpose of the act was as follows:

To reorganize the Department of Defense and strengthen civilian authority in the Department of Defense, to improve the military advice provided to the President, the National Security Council, and the Secretary of Defense, to place clear responsibility on the commanders of the unified and specified combatant commands for the accomplishment of missions assigned to those commands and ensure that the authority of those commanders is fully commensurate with that responsibility, to increase attention to the formulation of strategy and to contingency planning, to provide for more efficient use of defense resources, to improve joint officer management policies, otherwise to enhance the effectiveness of military operations and improve the management and administration of the Department of Defense, and for other purposes.

The Goldwater-Nichols Act caused a major defense reorganization, the most significant since the National Security Act of 1947. Operational authority was centralized through the Chairman of the Joint Chiefs as opposed to the service chiefs. The chairman was designated as the principal military advisor to the president, National Security Council, and secretary of defense. The act established the position of vice-chairman and streamlined the operational chain of command from the president to the secretary of defense to the unified commanders.

Since 1986, Goldwater-Nichols has resulted in tremendous changes in the way the Department of Defense operates and has made joint operations the norm, as in the Arabian Gulf, Zaire, Haiti, and Bosnia. Implementation of the act is an on-going project with Joint Vision 2010 (1996) and Joint Vision 2020 (2000). Both documents emphasize that to be the most effective force, the U.S. military must be fully joint: intellectually, operationally, organizationally, doctrinally, and technically. The joint force, because of its flexibility and responsiveness, will remain the key to operational success in the future.

MILITARY IDEALS

Oath of Enlistment

“I, _____, do solemnly swear (or affirm) that I will support and defend the Constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; and that I will obey the orders of the President of the United States and the orders of the officers appointed over me, according to regulations and the Uniform Code of Military Justice. So help me God.” (Title 10, US Code; Act of 5 May 1960 replacing the wording first adopted in 1789, with amendment effective 5 October 1962).

Code of Conduct for Members of the United States Armed Forces (Executive Order 10631)

I

I am an American, fighting in the forces which guard my country and our way of life. I am prepared to give my life in their defense.

[Article I amended by EO 12633 of Mar. 28, 1988, 53 FR 10355, 3 CFR, 1988 Comp., p. 561]

II

I will never surrender of my own free will. If in command, I will never surrender the members of my command while they still have the means to resist.

[Article II amended by EO 12633 of Mar. 28, 1988, 53 FR 10355, 3 CFR, 1988 Comp., p. 561]

III

If I am captured I will continue to resist by all means available. I will make every effort to escape and aid others to escape. I will accept neither parole nor special favors from the enemy.

IV

If I become a prisoner of war, I will keep faith with my fellow prisoners. I will give no information or take part in any action which might be harmful to my comrades. If I am senior, I will take command. If not, I will obey the lawful orders of those appointed over me and will back them up in every way.

V

When questioned, should I become a prisoner of war, I am required to give name, rank, service number and date of birth. I will evade answering further questions to the utmost of my ability. I will make no oral or written statements disloyal to my country and its allies or harmful to their cause.

[Article V amended by EO 12017 of Nov. 3, 1977, 42 FR 57941, 3 CFR, 1977 Comp., p. 152]

VI

I will never forget that I am an American, fighting for freedom, responsible for my actions, and dedicated to the principles which made my country free. I will trust in my God and in the United States of America.

[Article VI amended by EO 12633 of Mar. 28, 1988, 53 FR 10355, 3 CFR, 1988 Comp., p. 561]

By virtue of the authority vested in me as President of the United States, and as Commander in Chief of the armed forces of the United States, I hereby prescribe the Code of Conduct for Members of the Armed Forces of the United States which is attached to this order and hereby made a part thereof.

All members of the Armed Forces of the United States are expected to measure up to the standards embodied in this Code of Conduct while in combat or in captivity. To ensure achievement of these standards, members of the armed forces liable to capture shall be provided with specific training and instruction designed to better equip them to counter and withstand all enemy efforts against them, and shall be fully instructed as to the behavior and obligations expected of them during combat or captivity.

[Second paragraph amended by EO 12633 of Mar. 28, 1988, 53 FR 10355, 3 CFR, 1988 Comp., p. 561]

The Secretary of Defense (and the Secretary of Transportation with respect to the Coast Guard except when it is serving as part of the Navy) shall take such action as is deemed necessary to implement this order and to disseminate and make the said Code known to all members of the armed forces of the United States.

[Third paragraph amended by EO 11382 of Nov. 28, 1967, 32 FR 16247, 3 CFR, 1966–1970 Comp., p. 691]

U.S. Air Force Song: “Off We Go Into the Wild Blue Yonder”

In 1938, *Liberty Magazine* sponsored a contest for an official song of the Army Air Corps. The magazine received 757 entries. A group of Army Air Corps wives selected Robert Crawford’s song titled “What Do You Think of the Air Corps Now?” The title was changed to “The Air Force Song” when the Air Force became a separate branch of the military in 1947.

Crawford didn’t write “Hey!” he actually wrote “SHOUT!” without specifying the word to be shouted. Wherever they appear, the words “U.S. Air Force” have been changed from the original “Army Air Corps.” Words in parentheses are spoken, not sung.

*Off we go into the wild blue yonder,
Climbing high into the sun;*

*Here they come zooming to meet our thunder,
At 'em boys, Give 'er the gun! (Give 'er the gun now!)
Down we dive, spouting our flame from under,
Off with one helluva roar!
We live in fame or go down in flame. Hey!
Nothing'll stop the U.S. Air Force!*

*Minds of men fashioned a crate of thunder,
Sent it high into the blue;
Hands of men blasted the world asunder;
How they lived God only knew! (God only knew hey!)
Souls of men dreaming of skies to conquer
Gave us wings, ever to soar!
With scouts before and bombers galore. (Hey!)
Nothing'll stop the U.S. Air Force!*

*Here's a toast to the host
Of those who love the vastness of the sky,
To a friend we send a message of his brother men who fly.
We drink to those who gave their all of old,
Then down we roar to score the rainbow's pot of gold.
A toast to the host of men we boast, the U.S. Air Force!*

*Off we go into the wild sky yonder,
Keep the wings level and true;
If you'd live to be a grey-haired wonder
Keep the nose out of the blue! (Out of the blue, boy!)
Flying men, guarding the nation's border,
We'll be there, followed by more!
In echelon we carry on. Hey!
Nothing'll stop the Air Force!
Nothing'll stop the U.S. Air Force!*

U.S. Army Song: “The Army Goes Rolling Along”

The song was originally written by field artillery First Lieutenant (later Brigadier General) Edmund L. Gruber while he was stationed in the Philippines in 1908. The lyrics of this original version, called “The Caisson Song,” reflected routine activities in a horse-drawn field artillery battery. The song was transformed into a march by John Philip Sousa in 1917 and renamed “The Field Artillery Song.” It was adopted in 1952 as the official song of the Army and retitled “The Army Goes Rolling Along.”

“Caisson Song”

*Over hill, over dale,
We will hit the dusty trail,*

*And those Caissons go rolling along.
Up and down, in and out,
Counter march and left about,
And those Caissons go rolling along,
For it's high high he,
In the Field Artillery,
Shout out your "No" loud and strong,
For wher-e'er we go,
You will always know,
That those Caissons go rolling along.*

"The Army Goes Rolling Along": U.S. Army Song

Intro

*March along, sing our song, with the Army of the free
Count the brave, count the true, who have fought to victory
We're the Army and proud of our name
We're the Army and proudly proclaim*

Verse

*First to fight for the right,
And to build the Nation's might,
And The Army Goes Rolling Along
Proud of all we have done,
Fighting till the battle's won,
And the Army Goes Rolling Along.*

Refrain

*Then it's Hi! Hi! Hey!
The Army's on its way.
Count off the cadence loud and strong (TWO! THREE!)
For where e'er we go,
You will always know
That The Army Goes Rolling Along.*

Verse

*Valley Forge, Custer's ranks,
San Juan Hill and Patton's tanks,
And the Army went rolling along
Minute men, from the start,
Always fighting from the heart,
And the Army keeps rolling along.
(refrain)*

Verse

*Men in rags, men who froze,
Still that Army met its foes,*

*And the Army went rolling along.
Faith in God, then we're right,
And we'll fight with all our might,
As the Army keeps rolling along.
(refrain)*

U.S. Coast Guard Anthem: “Semper Paratus (Always Ready)”

The original words and music of the anthem were written by Captain Francis S. Van Boskerck, USCG, in 1927. The current verse and a second chorus were written by Homer Smith, 3rd Naval District Coast Guard quartet, Chief Cole, and LT Walton Butterfield USCGR in 1943. The first line of the original chorus, “So here’s the Coast Guard marching song,” was changed in 1969 to “We’re always ready for the call.”

Verse

*From Aztec Shore to Arctic Zone
To Europe and Far East.
The Flag is carried by our ships,
In times of war and peace.
And never have we struck it yet
In spite of foe-men’s might,
Who cheered our crews and cheered again,
For showing how to fight.*

Chorus

*We’re always ready for the call,
We place our trust in Thee.
Through surf and storm and howling gale,
High shall our purpose be.
“Semper Paratus” is our guide,
Our fame, our glory, too.
To fight to save or fight and die,
Aye! Coast Guard we are for you!*

U.S. Marine Corps Song: “The Marines’ Hymn”

The *Marines’ Hymn* is the oldest official song in the United States military. Some of the lyrics were popular phrases before the song was written. The line “To the shores of Tripoli” refers to the First

Barbary War, specifically the Battle of Derne in 1805. “The Halls of Montezuma” refers to the Battle of Chapultepec during the Mexican-American War, where a force of Marines stormed Chapultepec Castle.

The author of the lyrics is unknown, although legend has it that it was written by a Marine on duty in Mexico. The music is from the *Gendarmes’ Duet* from an 1867 revision of the 1859 opera *Geneviève de Brabant* by Jacques Offenbach, which debuted in Paris in 1859. Some websites claim that the Marine Corps secured a copyright on the song on August 19, 1891, but this is in error; the copyright was vested on August 18, 1919. In 1929, the Commandant of the Marine Corps authorized the three verses of the Marines’ Hymn as the official version, but changed the third and fourth lines:

Pre-1929 Version

*Admiration of the nation,
we’re the finest ever seen;
And we glory in the title
Of United States Marines.*

Authorized Change

*First to fight for right and freedom
And to keep our honor clean;
We are proud to claim the title
Of United States Marine.*

On November 21, 1942, Commandant Thomas Holcomb approved a change in the words of the first verse’s fourth line from “On the land as on the sea” to “In the air, on land, and sea” to reflect the addition of aviation to the Corp’s arsenal.

*From the Halls of Montezuma,
To the Shores of Tripoli;
We fight our country’s battles
In the air, on land, and sea;
First to fight for right and freedom
And to keep our honor clean;
We are proud to claim the title
Of UNITED STATES MARINES.*

*Our flag’s unfurled to every breeze,
From dawn to setting sun;
We have fought in every clime and place
Where we could take a gun;
In the snow of far off northern lands
And in sunny tropic scenes;
You will find us always on the job —
The UNITED STATES MARINES.*

*Here’s health to you and to our Corps
Which we are proud to serve;*

*In many a strife we've fought for life
And never lost our nerve;
If the Army and the Navy
Ever look on Heaven's scenes;
They will find the streets are guarded
By UNITED STATES MARINES.*

U.S. Navy Song: “Anchors Aweigh”

Lieutenant Charles A. Zimmermann, U.S. Navy, a graduate of the Peabody Conservatory in Baltimore, was selected as the bandmaster of the Naval Academy Band in 1887 at the age of 26. Early in his career, Zimmermann started the practice of composing a march for each graduating class. By 1892, he had become so popular that he was presented with a gold medal by that year's class. More gold medals followed as he wrote a march for each succeeding class.

In 1906, Zimmerman was approached by Midshipman First Class Alfred Hart Miles with a request for a new march. As a member of the Class of 1907, Miles and his classmates wanted an inspiring song that could be used as a football marching song, and that “would live forever.”

Supposedly, with the two men seated at the Naval Academy Chapel organ, Zimmermann composed the tune, and Miles wrote the two first stanzas in November 1906. This march was played by the band and sung by the brigade at the 1906 Army-Navy football game later that month, and for the first time in several seasons, Navy won. This march, *Anchors Aweigh*, was subsequently dedicated to the Academy Class of 1907. The concluding stanza was written by Midshipman Royal Lovell, Class of 1926. The lyrics were revised in the 1920s by George D. Lottman.

Original Lyrics

Verse 1

*Stand Navy down the field, sails set to the sky.
We'll never change our course, so Army you steer shy-y-y-y.
Roll up the score, Navy, Anchors Aweigh.
Sail Navy down the field and sink the Army, sink the Army Grey.*

Verse 2

*Get underway, Navy, Decks cleared for the fray,
We'll hoist true Navy Blue So Army down your Grey-y-y-y.
Full speed ahead, Navy; Army heave to,
Furl Black and Grey and Gold and hoist the Navy, hoist the Navy Blue*

Verse 3

*Blue of the Seven Seas; Gold of God's great sun
Let these our colors be Till all of time be done-n-n-ne,
By Severn shore we learn Navy's stern call:
Faith, courage, service true With honor over, honor over all.*

Revised Lyrics by George D. Lottman

Verse 2 is the most widely sung. The word “weigh” in this sense comes from the archaic word meaning to heave, hoist or raise. “Aweigh” means that that action has been completed. The anchor is aweigh when it is pulled from the bottom. This event is duly noted in the ship’s log.

Verse 1

*Stand, Navy, out to sea, Fight our battle cry;
We’ll never change our course, So vicious foe steer shy-y-y-y.
Roll out the TNT, Anchors Aweigh. Sail on to victory
And sink their bones to Davy Jones, hooray!*

Verse 2

*Anchors Aweigh, my boys, Anchors Aweigh.
Farewell to college joys, we sail at break of day-ay-ay-ay.
Through our last night on shore, drink to the foam,
Until we meet once more. Here’s wishing you a happy voyage home.*

Appendix 4

U.S. SUPREME COURT CASES

Ex Parte Milligan, 71 U.S. 2 (1866)

By the middle of the 19th century, military justice was a well-established process that operated without the involvement of Congress or federal courts. In 1858, however, the U.S. Supreme Court ruled in *Dynes v. Hoover*, 61 U.S. 65, that civil courts had no jurisdiction in the court-martial of Dynes, a sailor in the U.S. Navy. However, in 1866, the Court took up the case of Lambden P. Milligan, a civilian who had been convicted of engaging in acts of disloyalty during the Civil War and sentenced to death by a military commission in Indiana. Milligan sought release through habeas corpus from a federal court. In a unanimous decision, the U.S. Supreme Court held that Milligan's trial and sentence were unconstitutional. Writing for the Court, Chief Justice David Davis emphasized that the U.S. Constitution "is a law for rulers and people, equally in war and in peace, and covers with the shield of its protection all classes of men, at all times, and under all circumstances." Davis noted that martial law was appropriate when "war exists in a community and the courts and civil authorities are overthrown." However, it

cannot arise from a threatened invasion. The necessity must be actual and present; the invasion real, such [as] effectually closes the courts and deposes the civil administration. . . . Martial rule can never exist when the courts are open, and in the proper and unobstructed exercise of their jurisdiction.

Milligan established that judicial power lies with the Supreme Court and lower courts, not with a military tribunal such as the one that tried Milligan. Neither the president nor Congress could authorize such a proceeding. It is seen as a landmark case on the limits of military jurisdiction over civilians.

Ex Parte Quirin, 317 U.S. 1 (1942)

Ex Parte Quirin was a 1942 Supreme Court decision that allowed the military, instead of civil courts, to try foreign nationals from enemy countries caught entering the United States to commit destructive acts. This case concerned Operation Pastorius, a failed attempt in June 1942 by Nazi agents to sabotage various U.S. targets. Eight conspirators were arrested and, on the orders of President Franklin Roosevelt, were tried by a military commission. The commission found all eight men guilty and sentenced them to death. Arguing that the president exceeded his power in ordering the commission and that the Fifth and Sixth Amendments to the Constitution protected their rights to a regular trial, seven of the eight conspirators filed petitions for a writ of habeas corpus in federal district court. Their claims were denied, and they appealed to the U.S. Court of Appeals for the District of Columbia. Before the court ruled, however, they filed for hearing before the Supreme Court and, separately, filed petitions for habeas corpus directly with the Court. On July 31, 1942, in

a brief per curiam ruling, the Court stated that the military commission had been created under presidential authority properly exercised and that the petition for habeas corpus was therefore denied. In a full opinion issued on October 29, 1942, a unanimous Court concluded that the conspirators, as spies without uniform whose purpose was sabotage, violated the law of war and were therefore unlawful enemy combatants.

By universal agreement and practice, the law of war draws a distinction between the armed forces and the peaceful populations of belligerent nations, and also between those who are lawful and unlawful combatants. Lawful combatants are subject to capture and detention as prisoners of war by opposing military forces. Unlawful combatants are likewise subject to capture and detention, but, in addition, they are subject to trial and punishment by military tribunals for acts which render their belligerency unlawful.

We have no occasion now to define with meticulous care the ultimate boundaries of the jurisdiction of military tribunals to try persons according to the law of war. It is enough that petitioners here, upon the conceded facts, were plainly within those boundaries, and were held in good faith for trial by military commission, charged with being enemies who, with the purpose of destroying war materials and utilities, entered, or after entry remained in, our territory without uniform—an offense against the law of war. We hold only that those particular acts constitute an offense against the law of war which the Constitution authorizes to be tried by military commission.

The Court held that *Milligan* did not apply because Quirin and the others, unlike Milligan, were actual combatants in the war.

O’Callahan v. Parker, 395 U.S. 258 (1968)

Crimes identified in the Uniform Code of Military Justice include not only those specific to the military context, such as desertion, but also ones that are similar to offenses defined by state and federal law, such as assault, murder, and robbery. The constitutional limits on military jurisdiction have continued to evolve through decisions by the Supreme Court.

In *Toth v. Quarles*, 350 U.S. 11 (1955), the Supreme Court held that the military cannot try civilians—including former members of the military—for military crimes. However, in 1969, the Court held that the military jurisdiction could not be established simply by the fact that the person charged was a member of the military at the time of the offense and trial. According to the decision in *O’Callahan v. Parker*, establishing military jurisdiction in trials required a “service connection” between the crime and the alleged offender’s military duties. Writing for the Court, Justice William O. Douglas reiterated and expanded the *Toth* holding. He noted several important differences between a court-martial and a civil jury trial. For example, in a court-martial, the jury’s decision does not have to be unanimous and the accused is tried not by his or her peers but by a panel of officers. The presiding officer at a military trial “is not a judge whose objectivity and independence are protected by tenure . . . and nurtured by the judicial tradition, but is a military law officer.” Douglas pointed out that

the suggestion of the possibility of influence on the actions of the court-martial by the officer who convenes it, selects its members and the counsel on both sides, and who usually has direct command authority over its members is a pervasive one in military law. . . . A court martial is not yet an independent instrument of justice but remains to a significant degree a specialized part of the overall mechanism by which military discipline is preserved.

Solorio v. United States, 483 U.S. 435 (1987)

In *Solorio v. United States*, the Supreme Court again addressed the jurisdiction of military courts. At issue was whether the jurisdiction of a court-martial convened pursuant to the Uniform Code of Military Justice to try a member of the Armed Forces depended on the “service connection” of the offense charged. The Supreme Court ruled that it did not. Writing for the majority, Chief Justice William Rehnquist argued that *O’Callahan* had been decided wrongly and that military courts have jurisdiction over any service member, regardless of whether the offense is connected to the armed forces.

Richard Solorio sexually abused two daughters (ages 10–12) of a fellow coast-guardsmen for two years while serving in Juneau, Alaska. Coast Guard personnel in Juneau live in the civilian community rather than on an official base or post. The crimes that Solorio committed in Alaska occurred in his private home.

After a general court-martial was convened in New York, Solorio moved to dismiss the charges for crimes committed in Alaska. He argued that the court lacked jurisdiction because the crimes had taken place in a civilian home. The court-martial judge granted the motion to dismiss, ruling that the Alaska offenses were not sufficiently “service connected” to be tried in the military criminal justice system. The government appealed the dismissal of the charges to the U.S. Coast Guard Court of Military Review, which reversed the trial judge’s order and reinstated the charges.

The U.S. Court of Military Appeals affirmed the Court of Military Review, stating that although

not every off-base offense against a servicemember’s dependent is service-connected, sex offenses against young children . . . have a continuing effect on the victims and their families and ultimately on the morale of any military unit or organization to which the family member is assigned.

Justice Rehnquist noted that

In an unbroken line of decisions from 1866 to 1960, this Court interpreted the Constitution as conditioning the proper exercise of court-martial jurisdiction over an offense on one factor: the military status of the accused.

In 1969, the Court in *O’Callahan v. Parker* departed from the military status test and announced the “new constitutional principle” that a military tribunal may not try a serviceman charged with a crime that has no service connection. Applying this principle, the *O’Callahan* Court held that a serviceman’s off-base sexual assault on a civilian with no connection with the military could not be tried by court-martial. On reexamination of *O’Callahan*, we have decided that the service connection test announced in that decision should be abandoned. . . . The requirements of the Constitution are not violated where, as here, a court-martial is convened to try a serviceman who was a member of the Armed Services at the time of the offense charged.

In a dissent joined by Justices William Brennan and Harry Blackmun, Justice Thurgood Marshall characterized the majority opinion in *Solorio* as one in a long series of cases that reflected an unfortunate conviction that “members of the armed forces may be subject virtually without limit to the vagaries of military control.” For him, the majority’s “willingness to overturn precedent” meant that “every member of the armed forces, whose active members number in the millions, can now be subject to court martial jurisdiction . . . for *any* [emphasis in the original] offense, from tax fraud to passing a bad check, regardless of its lack of relation to military discipline, morale and fitness.” Justice Marshall argued that the *Solorio* decision “deprives our military personnel of procedural protections that are constitutionally mandated.”

Rights of Detainees Following the September 11 Attacks

In the wake of September 11, 2001, the Court has had numerous opportunities to revisit issues concerning the reach of military justice that have troubled the tribunal since 1866. After the attacks, President George W. Bush declared his intentions to pursue al Qaeda and any of its allies with military force. On September 18, 2001, Congress passed a resolution, the Authorization for Use of Military Force, that granted President Bush sweeping authority to “use all necessary and appropriate force” against any “nations, organizations, or persons” that he determined had taken part in planning, authorizing, committing, or aiding the attacks. U.S. troops were deployed to Afghanistan where al Qaeda’s leader, Osama bin Laden, was believed to be in hiding.

By early 2002, the United States had organized a facility in Guantánamo Bay, Cuba, for the indefinite detention of enemy combatants. As the war continued, more prisoners from combat operations in Afghanistan and other locations were sent to Guantánamo and confined in camps.

The case of *Hamdi v. Rumsfeld*, 542 U.S. 507 (2004) started with the capture in Afghanistan of a 20-year-old American citizen, Yaser Hamdi. After an interrogation by military authorities in Afghanistan, in

January 2002 he was brought to Guantánamo, where he was confined until April 2002. The U.S. government claimed that Hamdi was “an enemy combatant,” with the result that he could be held “in the United States indefinitely—without formal charges or proceedings”—and without aid of counsel.

Hamdi sought to have his detention ruled unconstitutional on the grounds that it violated his Fifth Amendment right to due process. Ultimately, the U.S. Supreme Court ruled on the question of whether the government violated Hamdi’s due process right by holding him indefinitely, without access to an attorney, based solely on an executive branch declaration that he was an “enemy combatant” who fought against the United States.

A four-justice plurality partly joined by two additional justices held that Fifth Amendment due process guarantees give a citizen held in the United States as an enemy combatant the right to contest that detention before a neutral decision maker. The Court found that the authorization to use military force allowed the use of the enemy combatant classification but did not sufficiently lay out an acceptable procedure for tribunals.

In *Rasul v. Bush*, 542 U.S. 466 (2004), the majority held that their jurisdiction extended to the detention facility in Guantánamo Bay, Cuba. Again, the Court stated that detentions could be authorized constitutionally but that the procedural safeguards afforded to detainees were inadequate. Congress responded by attempting twice (through the Detainee Treatment Act of 2005 and the Military Commissions Act of 2006) to authorize the detentions properly and to remove the Court’s authority to review detainees’ habeas claims. The Court, however, remained unconvinced and insisted in *Hamdan v. Rumsfeld*, 548 U.S. 557 (2006) and *Boumediene v. Bush*, 553 U.S. 723 (2008) that, while inmates could (and should) be tried by military commissions, independent review by federal judges had to be available under Article III of the Constitution and basic procedural safeguards had to be respected.

Appendix 5

MILITARY ORGANIZATION

The U.S. military consists of five branches of the United States Uniformed Services, headed by the president as commander in chief. The Air Force, Army, Navy, and Marine Corps are under the jurisdiction of the Department of Defense. The Coast Guard reports to the Department of Homeland Security during peacetime and to the Department of Defense (by way of the Navy) during wartime. In addition to active-duty members, National Guard units perform as active-duty members on a part-time basis in the Army and Air Force, as do reserve units in all five branches.

Today's Military, a website produced by the U.S. Department of Defense, contains information about all the branches of the U.S. Military: <http://www.todaysmilitary.com/service-branches>.

U.S. Department of Defense Organizational Chart

Figure 5.1

Source: Department of Defense, Office of the Director of Administration and Management. Retrieved from http://odam.defense.gov/omp/Functions/Organizational_Portfolios/Organization_and_Functions_Guidebook/DoD_Organization_March_2012.pdf

Unified Command Structure

Combatant Commands (COCOMs), as defined in the military's Unified Command Plan (UCP) consist of three commands defined in terms of function:

USSTRATCOM: United States Strategic Command

USSOCOM: United States Special Operations Command

USTRANSCOM: United States Transportation Command

and six geographic commands that operate worldwide in clearly delineated geographic areas:

USAFRIC: United States Africa Command
 USCENT: United States Central Command
 USEUCOM: United States European Command
 USNORTHCOM: United States Northern Command
 USPACOM: United States Pacific Command
 USSOUTHCOM: United States Southern Command

Since the passage of the Goldwater-Nichols Department of Defense Reorganization Act of 1986, the individual military services and their respective chiefs no longer have primary operational control over warfighting. Instead, they are directed to organize, train, modernize, and equip forces for use by the COCOMs. The COCOM commanders exercise unified command and are empowered to use each branch of the military to achieve the COCOMs' designated missions. Each combatant commander reports to the U.S. secretary of defense through the chairman of the Joints Chiefs of Staff and, through the secretary, to the president of the United States.

For a detailed description of the history and operation of command structure, see "The Unified Command Plan and Combatant Commands: Background and Issues for Congress," by Andrew Feickert (Congressional Research Service, January 3, 2013), available online at <http://www.fas.org/sgp/crs/natsec/R42077.pdf>.

See also entries in this encyclopedia on the U.S. Africa, Central, Pacific, and Southern Commands.

Organization of the U.S. Army

The army conducts both operational and institutional missions. The operational army consists of numbered armies, corps, divisions, brigades, and battalions that conduct full spectrum operations around the world. The institutional army supports the operational army. Institutional organizations provide the infrastructure necessary to raise, train, equip, deploy, and ensure the readiness of all army forces.

This figure shows the organization of U.S. Army operational units and the typical rank of the commander for each type of unit.

Figure 5.3 U.S. Army Operational Units and Rank

Source: Retrieved from <http://www.army.mil/info/organization/unitsandcommands/oud>

Ranks of Enlisted Soldiers in the U.S. Army

Private (PVT/PV2)

Lowest rank: a trainee who is starting basic combat training (BCT). Primary role is to carry out orders issued to him/her to the best of his/her ability.

Private First Class (PFC)

PV2s are promoted to this level after one year—or earlier by request of supervisor. Individual can begin BCT at this level with experience or prior military training. Carries out orders issued to him/her to the best of his/her ability.

Specialist (SPC)

Can manage other enlisted soldiers of lower rank. Has served a minimum of two years and attended a specific training class to earn this promotion. People enlisting with a four-year college degree can enter BCT as a Specialist.

Corporal (CPL)

The base of the noncommissioned officer (NCO) ranks, CPLs serve as team leader of the smallest army units. Like sergeants, they are responsible for individual training, personal appearance, and cleanliness of soldiers.

Sergeant (SGT)

Typically commands a squad (9 to 10 soldiers). Considered to have the greatest impact on soldiers because SGTs oversee them in their daily tasks. In short, SGTs set an example and the standard for privates to look up to and live up to.

Staff Sergeant (SSG)

Also commands a squad (9 to 10 soldiers). Often has one or more SGTs under his or her leadership. Responsible for developing, maintaining, and utilizing the full range of his or her soldiers' potential.

Sergeant First Class (SFC)

Key assistant and advisor to the platoon leader. Generally has 15 to 18 years of army experience and puts it to use by making quick, accurate decisions in the best interests of the soldiers and the country.

Master Sergeant (MSG)

Principal NCO at the battalion level, and often higher. Not charged with all the leadership responsibilities of a 1SG but is expected to dispatch leadership and other duties with the same professionalism.

First Sergeant (1SG)

Principal NCO and life-blood of the company: the provider, disciplinarian, and wise counselor. Instructs other SGTs, advises the commander, and helps train all enlisted soldiers. Assists officers at the company level (62 to 190 soldiers).

Sergeant Major (SGM)

SGMs' experience and abilities are equal to that of the CSM, but the sphere of influence regarding leadership is generally limited to those directly under his or her charge. Assists officers at the battalion level (300 to 1,000 soldiers).

Command Sergeant Major (CSM)

Functioning without supervision, a CSM's counsel is expected to be calm, settled, and accurate—with unflinching enthusiasm. Supplies recommendations to the commander and staff and carries out policies and

standards on the performance, training, appearance, and conduct of enlisted personnel. Assists officers at the brigade level (3,000 to 5,000 soldiers).

There is only one sergeant major of the army, who serves as the senior enlisted advisor and consultant to the chief of staff of the army (a four-star general).

Source: Defense Casualty Analysis System, https://www.dmdc.osd.mil/dcas/pages/report_by_year_manner.xhtml

A. Data prior to World War I are based on incomplete records in many cases. Casualty data are confined to dead and wounded and, therefore, exclude personnel captured or missing in action who were subsequently returned to military control.

B. Marine Corps data for World War II, the Spanish-American War, and prior wars represent the number of individuals wounded, whereas all other data in this column represent the total number (incidence) of wounds.

C. Not known, but estimates range from 184,000 to 250,000.

D. As reported by the Commissioner of Pensions in the annual report for fiscal year 1903.

E. Authoritative statistics for the Confederate forces are not available. Estimates of the number who served range from 600,000 to 1,500,000. The final report of the Provost Marshal General, 1863–1866, indicated 133,821 Confederate deaths (74,524 battle and 59,297 other) based upon incomplete returns. In addition, an estimated 26,000 to 31,000 Confederate personnel died in Union prisons.

F. Number serving covers the period April 21 to August 13, 1898, while dead and wounded data are for the period May 1 to August 31, 1898. Active hostilities ceased on August 13, 1898, but ratifications of the Treaty of Peace were not exchanged between the United States and Spain until April 11, 1899.

G. Includes air service. Battle deaths and wounds not mortal include casualties suffered by American forces in northern Russia to August 25, 1919, and in Siberia to April 1, 1920. Other deaths cover the period April 1, 1917, to December 31, 1918.

H. Data are for the period December 1, 1941, through December 31, 1946, when hostilities were officially terminated by Presidential Proclamation, but a few battle deaths or wounds not mortal were incurred after the Japanese acceptance of the Allied peace terms on August 14, 1945. Number serving from December 1, 1941, through August 31, 1945, were: Total - 14,903,213; Army - 10,420,000; Navy - 3,883,520; and Marine Corps - 599,693.

I. Includes army air forces.

J. Battle deaths and wounds not mortal include casualties incurred in October 1941 due to hostile action.

K. Worldwide military deaths during the Korean War totaled 54,246. In-theater casualty records are updated annually.

L. Number serving covers the period August 5, 1964 (“Vietnam era” begins), through January 27, 1973 (date of cease-fire). Deaths include the period November 1, 1955 (commencement date for the Military Assistance Advisory Group), through May 15, 1975 (date last American servicemember left Southeast Asia). Casualty records are updated annually, including current deaths that are directly attributed to combat in the Vietnam conflict. Additional detail now on table shows number of WIA servicemembers not requiring hospital care.

M. Coast Guard numbers are included with navy. Report does not include one POW (Speicher). Casualty records are updated annually.

N. The Marine Corps number serving is included in the navy total.
